

Session 5, *connected.*

A cross-domain connector playbook. Everything you learned today — that an **MCP is just a connector**, the concierge between your model and the apps where your work lives, and the **Problem → Tasks → Connectors → Orchestrate** way to run it — turned into concrete workflows you can build this week, in your field, whatever your field is.

INSIDE

Your Session 5 toolkit, recapped
The Model · Context · Protocol anatomy
One fully worked orchestration
30 workflows across 10 domains

DOMAINS COVERED

Operations · Sales · Marketing
Healthcare · Engineering · Legal
Finance · HR · Education · Personal

What you walked away with today

Yesterday you gave one agent a brain. Today you handed your LLM the keys to every app you already use — that is what a connector does, and it turns a chat box into the place your work gets done. These four building blocks are the whole of it. Before the workflows, here is the toolkit in one view. **Every workflow in this guide is built from one or more of these.**

SKILL 01

Connectors, Not Chat

An LLM on its own only talks. A **connector** — an MCP — plugs it into the apps where your work lives: Gmail, Notion, Slack, Asana. Now it can read from one app and act in another. That is the shift — from asking questions to getting work done.

USE IN: Claude • ChatGPT connectors

SKILL 02

API vs Webhook vs MCP

Same food court, three ways to get fed. An **API** is you checking every counter yourself. A **webhook** pings you when the food is ready. An **MCP** is the concierge who takes your order and brings the whole tray to your table. MCP is delegation.

USE IN: The concierge model

SKILL 03

Model • Context • Protocol

Unpack the name. **Model** is the LLM you talk to. **Context** is the apps where your work actually lives. **Protocol** is the shared rules that let them talk — the universal travel adapter Anthropic proposed, and everyone else had to adopt.

USE IN: The USB of LLMs

SKILL 04

Name the Connector

The one habit that saves you money: say which connector to use. Left to guess, the model picks the wrong tool and burns tokens. Be specific — “use Booking.com,” “use Notion” — and always end with *“ask me clarifying questions.”*

USE IN: Token-smart prompting

THE ONE IDEA THAT TIES IT ALL TOGETHER

A connector lets your model **collect context from one app and hand it to another to get the job done**. Pick the model, name the apps, and let it orchestrate — the LLM stops being a chat box and becomes the **operating system for your work**. Get that right and it runs your busywork while you do the rest.

Problem → Tasks → Connectors → Orchestrate

No matter what you build with connectors, it comes down to these four moves — start from the problem, not the tool. Name the tasks, map each to a connector, and let the model run the pipeline. This is the single most useful card in this guide.

USE IT FOR EVERY WORKFLOW

Problem → Tasks → Connectors → Orchestrate

1 · PROBLEM

Start with the real thing you want solved — revise my old notes, plan this trip, brief me for this call. Not a tool hunting for a use; a problem worth the model's time.

2 · TASKS

Break the problem into the steps a person would take — surface the notes, write the summary, build the deck. Clear tasks are what make everything after this obvious.

3 · CONNECTORS

Map each task to where it lives — the app that holds the data or does the action. Notion for notes, Gamma for slides, Gmail to send. Some tasks need no tool; the model does those.

4 · ORCHESTRATE

Hand the whole pipeline to the model in one prompt and let it run — read, compress, build. Name the connectors so it doesn't guess, and ask it to check back with questions first.

WORKED EXAMPLE · THE LEARNING DECK FROM CLASS

The four moves, run as one prompt

[PROBLEM] Years of learning notes sit in **Notion**, unread. How do you revise them without re-reading everything? That is the problem — and it is worth solving well.

[TASKS] Three steps fall out of it: **surface** the relevant notes, write a tight **summary**, then turn the summary into a **deck** you will actually look at.

[CONNECTORS] Each task picks its tool. Notion holds the notes, the LLM writes the summary itself, and **Gamma** turns it into slides. Two connectors, one model — nothing more.

[ORCHESTRATE] One prompt hands Claude the whole pipeline: it reads Notion, compresses the notes, and builds the deck in your theme.

The single prompt — problem stated, connectors named:

Go to my Notion and find my notes on how to learn, read and retain best. Pull the relevant ones, write a tight summary of the key ideas, then use Gamma to turn that summary into a presentation in the Outskill theme. Ask me clarifying questions before you build.

Notice the shape: problem first, tools last. Name the connectors, and the model does the running.

30 workflows, 10 domains

Pick your field, or borrow from another — the moves transfer. Start with the one that solves a problem you actually have this week. Each card is tagged with the connector pattern it uses, and the colour on its left edge matches.

CONTEXT → CREATE

RESEARCH & BRIEF

CONCIERGE

CAPTURE → TASKS

DATA → DASHBOARD

= EVERY WORKFLOW PULLS CONTEXT FROM ONE APP AND HANDS IT TO ANOTHER TO GET THE JOB DONE

01 Operations & Supply Chain

YOUR CONCIERGE ON THE OPS DESK

Vendor Order Concierge

CONCIERGE

Placing and chasing orders across supplier portals and email is a full-time babysitting job.

BUILD IT

Name **Gmail** and your supplier apps (or a **Sheets** order log). Claude places each order, tracks the confirmations, and hands you one clean status back — the food-court concierge, pointed at procurement.

Name each vendor connector so it never orders from the wrong one.

SOP Answer Desk

CONTEXT → CREATE

Staff ask the same “how do we do this?” questions and dig through docs for the answer.

BUILD IT

Connect **Notion** and **Slack**. Ask Claude to pull the relevant SOP from Notion and post a plain-language answer into the team channel — the context lives in Notion, the answer lands where people work.

Weekly Ops Report

DATA → DASHBOARD

The Monday status deck is assembled by hand from a sheet every single week.

BUILD IT

Point Claude at **Google Drive** or **Sheets** plus **Gamma**. It reads the ops sheet, surfaces the exceptions, and builds the weekly report deck for you to glance at and send.

Prospect Brief Builder

RESEARCH & BRIEF

Every discovery call needs a one-pager on the account, and you never have the time.

BUILD IT

Use **Web Research** (built into Claude) with **Notion**. Claude researches the company, pulls your offer notes from Notion, and writes a tight call-prep brief.

Inbound Lead Concierge

CONCIERGE

A new lead means bouncing between calendar, inbox and notes before anyone replies.

BUILD IT

Name **Google Calendar** and **Gmail**. Claude proposes times, drafts the intro email, and books the hold once you approve.

Draft, never auto-send — you verify before it leaves the building.

Pipeline Digest

DATA → DASHBOARD

Leadership wants a glance at the pipeline, not another spreadsheet to open.

BUILD IT

Connect your CRM or **Sheets** with **Gamma**. Claude summarises the pipeline and builds a two-minute dashboard a manager can read in one look.

Newsletter → Flyer

CONTEXT → CREATE

Newsletters pile up unread, and you want the gist as something you can actually share.

BUILD IT

The exact demo from class: connect **Gmail** and **Canva**. Claude finds the latest issue, extracts the key points, and builds a one-page summary flyer in Canva you can edit.

Repurpose to a Deck

CONTEXT → CREATE

A long blog post or doc needs to become a slide story, and rebuilding it is tedious.

BUILD IT

Connect **Notion** or **Google Drive** with **Gamma**. Claude compresses the source and builds a deck in your brand theme.

Name the theme in the prompt or it will pick its own.

Competitor Watch Brief

RESEARCH & BRIEF

Keeping tabs on what competitors ship eats an afternoon you do not have.

BUILD IT

Use **Web Research** with **Slack**. Claude scans for recent moves and posts a tight weekly brief straight into your marketing channel.

Podcast → Action Points

CONTEXT → CREATE

A two-hour health podcast holds the advice, but you will never sit through it.

BUILD IT

The YouTube demo from class: Claude (or Codex) extracts the transcript — even in another language — translates it, and distills the practical advice into action points.

General wellness only — not a substitute for a clinician.

Visit Notes → Follow-ups

CAPTURE → TASKS

After a consult, the follow-ups get lost in scribbled notes.

BUILD IT

Connect **Granola** or **Fireflies** with **Asana**. Claude turns the notes into a checklist of follow-ups with owners.

Add “no PII in the output” whenever you are sharing a screen.

Guideline Answer Desk

CONTEXT → CREATE

Staff hunt through policy PDFs to find the current protocol.

BUILD IT

Connect **Notion** or **Drive** with **Slack**. Claude retrieves the relevant guideline and answers in the team channel — from your source of truth, not a guess.

Mockup From a Prompt

CONTEXT → CREATE

You need front-end mockup screens, but you are not a designer.

BUILD IT

The parenting-app demo: connect the **Paper Design** MCP with Codex or Claude. Describe the app and the agent builds the mockup screens on a named page while your hands are off the keyboard.

Decent-and-fast beats perfect-and-never; hand it to a designer after.

Grounded Vibe-Coding

RESEARCH & BRIEF

The model invents outdated APIs the moment you start building.

BUILD IT

Add **Context7** in Claude. It feeds the latest libraries for any code, so your vibe-coding stops hallucinating — the one connector Dileep never codes without.

Issue Triage to the Board

CAPTURE → TASKS

Bug reports scatter across GitHub and chat and never make it onto the board.

BUILD IT

Connect **GitHub** with **Asana**. Claude reads new issues, drafts tasks with priorities and subtasks, and puts them on the board for review.

Contract Point Extractor

RESEARCH & BRIEF

Reading a long agreement for the clauses that matter is slow, careful work.

BUILD IT

Connect **Google Drive** with **Notion**. Claude reads the document, extracts key clauses and risks, and logs a summary to a Notion review page.

This is triage for a human to check — not legal advice.

Policy Answer Desk

CONTEXT → CREATE

The business keeps asking “are we allowed to...” and waiting on you.

BUILD IT

Connect **Notion** with **Slack**. Claude answers from your policy library in the channel, citing the source doc it drew from.

Obligation Tracker

CAPTURE → TASKS

Renewal and filing dates slip because nobody is watching the calendar.

BUILD IT

Connect **Google Calendar** with **Asana**. Claude reads the obligations and creates dated tasks and reminders so nothing lapses.

CEO Decision Dashboard

DATA → DASHBOARD

A dataset needs to become a two-minute answer a CEO can act on.

BUILD IT

The flagship demo: upload the data or connect **Google Drive**, add **Web Research** and **Context7**. Claude analyses it pyramid-principle style, augments it with the latest figures, and builds a glanceable dashboard.

Always end the prompt with “ask me clarifying questions.”

Product Analytics Q&A

RESEARCH & BRIEF

You want answers from your analytics without writing a single query.

BUILD IT

Connect **PostHog**. Ask Claude a funnel or retention question in plain words and it queries the analytics and answers — exactly how Outskill reads its own growth data.

Month-End Expense Digest

DATA → DASHBOARD

Monthly spend needs a readable summary, not a raw export.

BUILD IT

Connect **Sheets** or **Drive** with **Gamma**. Claude categorises the spend, flags anomalies, and builds the month-end summary.

JD → Candidate Shortlist

RESEARCH & BRIEF

Matching a role to real candidates is slow, manual searching.

BUILD IT

Connect **Indeed** or **LinkedIn** with **Notion**. From a job description, Claude surfaces matching profiles and logs a shortlist to Notion.

Name the board so it searches the right one.

Interview Notes → Scorecard

CAPTURE → TASKS

Panel feedback is scattered across notes after every interview.

BUILD IT

Connect **Granola** or **Fireflies** with **Asana**. Claude turns interview notes into a structured scorecard and next-step tasks.

Onboarding Concierge

CONCIERGE

A new hire's first week needs accounts, invites and a plan — all at once.

BUILD IT

Name **Gmail**, **Google Calendar** and **Asana**. Claude drafts the welcome, books the intro meetings, and builds the onboarding checklist for you to approve.

Notes → Revision Deck

CONTEXT → CREATE

Years of notes sit unread in Notion, doing nothing for you.

BUILD IT

The framework demo in one line: connect **Notion** and **Gamma**. Claude surfaces the relevant notes, writes a tight summary, and builds a revision deck in your theme.

Course Builder From a Doc

CONTEXT → CREATE

Source material needs to become a lesson, and formatting it by hand is slow.

BUILD IT

Connect **Google Drive** with **Gamma**. Claude turns a reference doc into a structured lesson deck with clear takeaways.

Reading Digest

RESEARCH & BRIEF

A long article or video will not get watched, so its value is lost.

BUILD IT

Use **Web Research** or Codex with **Notion**. Claude distills it into action points and files them in your learning journal for later revision.

Resume From Your Profile

CONTEXT → CREATE

Rewriting your resume from a blank page is a chore you keep putting off.

BUILD IT

The opening demo: pull your **LinkedIn** highlights with an assistant, then hand them to the **Enhanced CV** connector. Claude formats a clean, ATS-friendly resume in several variations to download.

Trip Concierge

CONCIERGE

A multi-city trip means juggling flights, hotels and dates across a dozen tabs.

BUILD IT

The flagship concierge demo: name **Expedia**, **Skyscanner** and **Booking.com**, describe the trip, and Claude plans the whole itinerary and options — you relax at the table.

Give it plenty of context and your budget up front.

Job Match Finder

RESEARCH & BRIEF

Sifting job boards against your background is tedious and easy to give up on.

BUILD IT

Connect **Indeed**. Paste your resume points, name Indeed, and Claude returns the roles that actually fit your profile and which to prioritise.

Your 20-minute starter

Reading isn't building. The fastest way to lock in today is the exact capstone the session set — turn a set of messy meeting notes into a **task board** and a **team deck**, entirely from Claude's connectors. A sample notes doc is in the workbook. This turns Session 5 from notes into a **workflow you own**.

BUILD YOUR FIRST CONNECTOR WORKFLOW

Turn one meeting into a board and a deck

Be a cook before you are a chef: follow these steps exactly first. Once it works end-to-end, change one thing at a time.

- 1 Open **Claude on the web** — connectors are now free there. Grab the sample meeting notes from the workbook and paste them in.
- 2 In the prompt, connect two connectors **by name**: **Asana** and **Gamma**. Naming them is what stops the model reaching for the wrong tool and burning tokens.
- 3 Ask Claude to **summarise** the notes and pull clean **action items** — owners and priorities included. Read its thinking as it works; that is how you learn to prompt it well.
- 4 Have it build an **Asana task board** from those action items, with the right people and priorities, for you to review before anything is final.
- 5 Then have it turn the same notes into a **Gamma deck** — a clean summary of the meeting for your team. Watch your token usage and stick to the workbook.

NEXT SESSION

Tomorrow is a full day. First half: **voice agents** — build and deploy one that talks. Second half: **vibe coding** — ship real products without writing code. On Sunday you build **Jerry**, your own multi-agent system. Everything you connected today carries straight over.

“An LLM on its own only talks. Connect it to where your work lives, and it stops answering questions and starts doing the work.”

— SESSION 5, AI ACCELERATOR PROGRAM
