

AI ACCELERATOR PROGRAM

Build and Deploy Your Portfolio Website

LinkedIn to Live Vercel Link

A Complete Step-by-Step Guide

USE CASE - Create a simple personal portfolio website from your LinkedIn profile. In the live session, you will build it with Antigravity, push it to GitHub, and deploy it on Vercel so you leave with a public website link.

NO CODING KNOWLEDGE NEEDED

This workbook is for a total beginner. Move slowly. Copy each prompt box as one full block. Paste it once into Antigravity. Do not type prompts line by line.

MODEL TO USE

Recommended model: Gemini 3.5 Flash (Low).

Use it for: setup, reading the LinkedIn PDF, building the website, GitHub, and Vercel.

Do not switch models casually: higher or thinking models can use more credits.

 **Credit note:** Use Gemini 3.5 Flash (Low) and avoid extra optional prompts until your Vercel link works. The goal is to finish the full deployment first.

What You Will Do - At a Glance

What you build: A simple personal portfolio website with your name, intro, about section, work experience, skills, projects, and contact links.

What you need today: Antigravity IDE, your LinkedIn PDF, a free GitHub account, and a free Vercel account.

What you get today: A public vercel.app link that other people can open.

Checkpoint before deploy: A localhost preview link that opens your portfolio on your laptop.

Important rule: Do not approve payment screens. This workbook follows the free path.

Prerequisites

Google account: <https://accounts.google.com/>

GitHub account: <https://github.com/signup>

Vercel account: <https://vercel.com/signup>

 **If you do not have these yet:** That is okay. You can create or sign into these accounts when the workbook reaches that step.

What Is Antigravity?

Antigravity IDE: A vibe coding app that sits on your computer and helps you build software by giving prompts in simple English.

Works on: Mac and Windows.

What it does here: It reads your LinkedIn profile, creates the website files, runs the website, pushes the code to GitHub, and helps deploy it on Vercel.

⚠ **Mac and Windows learners:** You can follow the same workbook. The only difference is during download: Mac users choose the Mac option, and Windows users choose the Windows option.

Part A - Install Antigravity IDE

Step 1: Open the official download page

1. Open this page in your browser: <https://antigravity.google/download#antigravity-ide>
2. Scroll down until you see the section title Antigravity IDE.

If you have MAC laptop: Download Mac, or windows

```
irm https://antigravity.google/cli/install.ps1 | iex
```

Windows CMD

```
curl -fsSL https://antigravity.google/cli/install.cmd -o install.cmd && install.cmd && del install.cmd
```

2. Scroll down. Stop only when the heading says Antigravity IDE.

Antigravity IDE

macOS

Download for Apple Silicon

Download for Intel

Windows

Download for x64

Download for ARM64

Linux

Download for x64

Download for ARM64

Mac learners use this macOS column in Step 2. Windows learners use this Windows column in Step 2.

Antigravity SDK

Work with Antigravity directly in your codebase. Build, debug, and ship from your terminal. Describe what you

3. Do not choose Antigravity 2.0, Antigravity CLI, or Antigravity SDK.

⚠ **Important:** Only download from the official Antigravity page.

Step 2: Install it on your Mac or windows

⚠ **Windows users:** If you are on Windows, select the Windows download instead of Mac. After Antigravity is installed, the rest of the workbook works the same way.

4. If your Mac has M1, M2, M3, or M4, choose Apple Silicon. If you have Windows, click x64

5. If your Mac is older and uses Intel, choose Intel. If windows is older, choose ARM64

6. Download the DMG file.

7. Open the DMG file.

8. Drag Antigravity IDE into Applications.

9. Open Antigravity IDE from Applications.

10. Click Continue with Google.

11. Choose the Google account you want to use.

12. When the success screen appears, click Next.

13. Confirm Antigravity opens with the Agent panel.

i Windows note: Most Windows laptops use Windows x64. Use ARM64 only if you already know your laptop uses ARM.

Part B - Create Your Project Folder

Step 3: Make a clean folder on Desktop

14. Open Finder.

15. Click Desktop in the left sidebar.

16. Create a new folder on Desktop.

17. Folder name: portfolio website

18. Open the folder named portfolio website.

19. At first, the folder can be empty.

✓ **Checkpoint:** The folder name is exactly portfolio website. Do not add extra words before or after the folder name.

Part C - Save Your LinkedIn Profile

Step 4: Save LinkedIn as a PDF

20. Open your LinkedIn profile in the browser.

21. Find the More button or three-dot menu near your profile name.

22. Click Save to PDF.

23. Wait for the PDF to download.

24. Open Downloads.

25. Move the PDF into the Desktop folder named portfolio website.

26. If you want, rename it to LinkedIn-Profile.pdf.

 **If Save to PDF is missing:** Copy your headline, About, Experience, Education, Skills, Projects, Certifications, LinkedIn link, and GitHub link into a plain text note. Put that note in the same folder.

Part D - Open The Folder In Antigravity

Step 5: Add the folder as a project

27. Open Antigravity.

28. Click the option to create or open a project.

29. Choose Add Folder or Select Folder.

30. Choose Desktop.

31. Choose portfolio website.

32. Keep the project name as portfolio website.

33. If AntigraVity asks for security settings, choose Default.

Step 6: First prompt

34. Copy the full prompt box.

Prompt 1: First Folder Check

```
I am new to this.
Please help me slowly.

I want to make a simple portfolio website from my LinkedIn profile.

My LinkedIn profile link is:
https://www.linkedin.com/in/harshith-vaddiparthy/

Before you paste this prompt, replace the link above with your own LinkedIn
profile link.
This activates AntigraVity's scraper so it can read your public LinkedIn page
and get better context for your website.

Please look inside this folder first.
The folder is called `portfolio website`.
My LinkedIn PDF is inside the folder.

Do not build the website yet.
First tell me:
1. What files you see in the folder.
2. Whether you can open and read the LinkedIn PDF.
3. A simple summary of my LinkedIn content: name, headline, About,
experience, education, skills, projects, certifications, and links.
4. Anything missing or unclear.
5. What tools you may need to check before building.
6. What you may ask me to approve.

Rules:
- Use very simple words.
- Do not assume I know coding.
- Do not ask me to run commands myself.
- Do not invent jobs, companies, projects, skills, or achievements.
- If something is missing, ask me before guessing.
- Do not build the website until I confirm the summary.
```

35. Paste the full prompt into AntigraVity once.

36. Press Send.

37. If Antigravity asks Allow running this command?, choose Yes, allow this time.

38. Click Submit.

39. You may need to approve more than once while Antigravity checks files or tools.
40. If you see Allow always for this project, you can choose it for repeated safe setup or checking actions that Antigravity explains.

⚠ **Approval note:** Antigravity may ask for permission several times. This is normal when it reads files, checks tools, or runs setup checks. If you are unsure what it is asking for, pause and ask a helper.

✅ **Expected result:** Antigravity tells you what it found. It may ask to check tools like Node, npm, Git, and GitHub CLI.

Part E - Install Required Tools

Step 7: Install tools and sign in to GitHub

41. Copy the full prompt box.
42. Paste it into Antigravity once.
43. Let Antigravity install or verify each required tool.

Prompt 2: Install Tools And Sign In To GitHub

I need you to set up this computer for building and publishing my portfolio website.

Please install or confirm that these tools are installed and working:

1. Node.js
2. npm
3. Git
4. GitHub CLI

Important:

- Do not ask me to run terminal commands myself.
- If something is already installed, check that it works.
- If something is missing, install it from the official source or the safest beginner-friendly method.

- Before every install or important change, explain what you are about to do in simple words.
- If macOS asks for my computer password, tell me why it is asking.
- Do not ask for my GitHub password inside Antigravity chat.
- Do not create a GitHub repository yet.
- Do not push any code yet.

After Node.js and npm are ready, verify that both work.

After Git is ready, verify that it works.

After GitHub CLI is installed, help me sign in to GitHub CLI.

Use the browser/device login flow if available.

When GitHub CLI gives a login link and one-time code:

1. Show me the link clearly.
2. Show me the one-time code clearly.
3. Tell me to open the link in my browser.
4. Tell me to paste or type the code on the GitHub page.
5. Wait for me to finish authentication.
6. Then verify that GitHub CLI is signed in.

At the end, show me a simple checklist:

- Node.js works
- npm works
- Git works
- GitHub CLI works
- GitHub CLI is signed in

Use very simple words.

Move slowly.

44. If Antigravity asks for approval, read the explanation and allow the safe setup action.

45. When Antigravity shows the GitHub login link and one-time code, open the link in your browser.

Use this link and code for GitHub login

Here is the login link and the one-time code generated by the GitHub tool.

Please follow these steps:

1. **Open this link in your web browser:** <https://github.com/login/device>
2. **Paste or type this code into the box** **Open the link** **ge:** F3A5-17A6
3. **Finish the login:** Follow the instructions of **Copy this code** your browser to sign in.

Once you are done, please come back here and let me know. I will wait for you!

46. If GitHub opens in the browser, sign in or create a free GitHub account.

47. If GitHub asks you to continue with your account, click Continue.

48. When GitHub shows a code box, enter the code AntigraVity gives you, then click Continue.

49. Review the GitHub CLI authorization screen, then click Authorize github.

Authorize GitHub CLI

Authorize GitHub CLI

Request location hidden for privacy.
Only continue if this is your own login.

GitHub CLI by [GitHub](#)

wants to access your harshith-vaddiparthi account

Existing access

- ✓ Full control of user public keys
- ✓ Delete repositories
- ✓ Create gists
- ✓ Full control of projects
- ✓ Read org and team membership, read org projects
- ✓ Full control of private repositories
- ✓ Update github action workflows

Organization access

-  Agent-mag ✓
-  Harshith-Ventures ✓
-  supalaunch ✓
-  zavata-ai ✓

50. When GitHub says Congratulations, you're all set, return to Antigravity.

51. Wait until Antigravity confirms GitHub CLI is signed in.

✓ **Expected result:** Node.js, npm, Git, and GitHub CLI are installed and working. GitHub CLI is signed in before you move ahead.

⚠ **If something fails:** Paste the error back into Antigravity and ask it to explain the problem in simple words, fix it, and try again.

Part F - Add Design Help

Step 8: Add Taste Skill

Command already included in the prompt: `npx skills add Leonxlnx/taste-skill`

52. Look at the Taste Skill website screenshot. This shows where the command appears. You do not need to copy it from the website because the prompt already includes it.

Prompt 3: Add Design Help

Please run this command for me:
`npx skills add Leonxlnx/taste-skill`

Do not ask me to run commands manually.

After it finishes, stop.

In the next chat, we will build the full website.

53. Paste Prompt 3 into Antigravity and send it.

54. If Antigravity asks for permission to run the command, choose an allow option and click Submit.

55. Wait until Antigravity confirms Taste Skill was added.

Part G - Build The Website

Step 9: Create the first version

Prompt 4: Build The Portfolio

Taste Skill is already installed in this project.

Now use Taste Skill to build my personal portfolio website using my LinkedIn PDF and my LinkedIn profile link.

Create this as a simple Next.js project.
Use Tailwind CSS if it helps make the design clean.

Important:

Replace the LinkedIn profile link below with your own LinkedIn profile link before sending this prompt.

My LinkedIn profile link:

<https://www.linkedin.com/in/harshith-vaddiparthi/>

Make it simple, modern, and mobile-friendly.
Use Taste Skill to improve the design quality.

Use my real content.

Do not leave placeholder text.
Do not add fake jobs, fake projects, or fake achievements.
If something is missing or unclear, ask me before guessing.

The website must include:

1. Intro section
2. About me
3. Work experience
4. Skills
5. Projects or featured work
6. Contact section
7. LinkedIn link
8. GitHub link if I have one

Use a free setup.

Do not add a database.

Do not add paid services.

Do not add API keys.

Do not add a login system.

Build the complete first version of the website.
Then run it on my computer and open it in the browser.
Give me the clickable localhost link.

If anything breaks:

1. Read the error.
2. Explain the error in simple words.
3. Fix it.
4. Try again.

Do not ask me to understand terminal errors.

Do not ask me to run commands myself.

After it opens, explain what you created in simple words.

✅ **Website must have:** real name, real headline, at least five sections, no placeholder text, a clean mobile layout, and a clickable localhost link.

i **Watch the left side:** As Antigravity builds, the Explorer on the left will fill with new folders and files like .next, node_modules, public, src/app, package.json, and README.md.

56. Before sending Prompt 4, replace the LinkedIn URL with your own LinkedIn profile URL.

57. Paste Prompt 4 into Antigravity and send it.

58. If Antigravity shows an implementation plan, review it and click Proceed.

59. Watch the left Explorer panel. New project folders and files will appear as Antigravity builds the website.

New project files appear here

skills-lock.json U

tsconfig.json

i Local preview: This link works only on your laptop. It is not the public website link yet.

60. When AntigraVity says the website is ready, click or copy the localhost link.

Copy or click the localhost link

Here is the clickable link to open your local portfolio website in your browser:

👉 <http://localhost:3000>

Summary of what I did:

- I created a **Next.js** project in your folder.
- I installed **Phosphor Icons** for modern visuals and **Framer Motion** for animations.
- I styled it using **Tailwind CSS v4** with a premium dark-tech theme (**#0A0908** background, **#E8E4DC** cream text, and rust accents).
- I added all your real work experience (JustPaid, Harshith Ventures, ARTIFIN.ai, Metaschool), skills, featured work (like Vibe Coding), and social links.
- I ran a compiler check to make sure there are no errors.
- I verified that the layout collapses beautifully on mobile screens.

I have saved a summary of the project and a screenshot of the homepage inside your workspace: 👉

- walkthrough.md

Antigravity summarizes what it built

- Walkthrough

Walkthrough of the Next.js portfolio website project implementation. Includes summaries of setup steps, code additions, and verification details along with screenshots.

61. Check that the portfolio opens in the browser at localhost.

62. Scroll through the page and check that the sections look correct.

Local preview URL: _____

Part H - Publish Code To GitHub

Step 10: Publish the code to GitHub

GitHub stores your website code online. Vercel will use this GitHub repo to publish your website.

63. If you do not have GitHub, create a free GitHub account.
64. If GitHub asks you to verify your email, do it in the browser.

Prompt 5: Publish To GitHub

```
Please publish this portfolio project to GitHub.

I am a beginner.
Do not ask me to run commands manually.

Please do this for me:
1. Check that the website works locally.
2. Check that the website can build successfully.
3. Check that no passwords, API keys, tokens, or secret files are inside the
project.
4. Check whether my LinkedIn PDF or resume is inside the project.
5. Do not upload the LinkedIn PDF or resume to GitHub.
6. Create or update a simple README file that explains this is my personal
portfolio website.
7. Check if I am signed into GitHub.
8. If I am not signed in, open the browser login and guide me.
9. Create a new private GitHub repository for this project.
10. Use a clean name like portfolio-website.
11. Push the project code to the main branch.
12. After it works, give me the clickable GitHub repository link.

Important:
- The GitHub repo should be private.
- The code should be pushed directly after the safety checks pass.
- If the repo name is already taken, choose a clean similar name.
- Do not upload my LinkedIn PDF or resume.
- Explain what happened in simple words.
```

65. When AntigraVity says the project was published, click the GitHub repository link it gives you.

Click the GitHub repository link linked to a private GitHub repo:

Open the GitHub repository

What I did:

- Verified the site runs locally in the browser.
- Verified `npm run build` succeeds.
- Also fixed a tiny lint issue and confirmed `npm run lint` passes.
- Found the LinkedIn PDF in the project, but kept it ignored.
- Confirmed no PDF, resume, or LinkedIn file was uploaded to GitHub.
- Scanned for common passwords, API keys, tokens, secret files, and `.env` files.
- Updated the README so it clearly describes the portfolio website.
- Created the private GitHub repo `portfolio-website`.
- Pushed the code to the `main` branch.

Confirm repo name + main branch

66. Confirm GitHub opens the private portfolio-website repository.

The screenshot shows the GitHub web interface for a repository named 'portfolio-website' under the user 'harshith-vaddiparthi'. The repository is private. A red box highlights the repository name 'portfolio-website' in the header, with a red arrow pointing to it from the text 'Private GitHub repo is created'. Another red box highlights the file list, with a red arrow pointing to it from the text 'Project files are uploaded'. The file list includes:

File	Commit Message	Time Ago
public	Initial commit from Create Next App	30 minutes ago
src/app	Publish portfolio website	1 minute ago
.gitignore	Publish portfolio website	1 minute ago
AGENTS.md	Initial commit from Create Next App	30 minutes ago
CLAUDE.md	Initial commit from Create Next App	30 minutes ago
README.md	Publish portfolio website	1 minute ago
eslint.config.mjs	Initial commit from Create Next App	30 minutes ago
next.config.ts	Initial commit from Create Next App	30 minutes ago
package-lock.json	Publish portfolio website	1 minute ago
package.json	Publish portfolio website	1 minute ago
postcss.config.mjs	Initial commit from Create Next App	30 minutes ago
tsconfig.json	Initial commit from Create Next App	30 minutes ago

The right sidebar shows the repository's metadata, including 'About', 'Releases', 'Packages', 'Contributors', and 'Languages'.

Part I - Deploy On Vercel

Step 11: Deploy the GitHub repo on Vercel

Vercel turns your GitHub code into a public website link. This is the final publishing step for today's worksheet.

67. Open <https://vercel.com/>

68. Click Log In.

69. Choose Continue with GitHub.

70. If GitHub asks you to sign in, sign in to GitHub.

71. Approve the GitHub connection if Vercel asks.

72. Go to the Vercel dashboard.

73. Click Add New.

74. Click Project.

75. Find your portfolio GitHub repository.

76. Click Import.

77. Keep the default settings.

78. Make sure the plan is Hobby or free.

79. Click Deploy.

80. Wait until Vercel says the deployment is done.

81. Open the live site.
82. Copy the vercel.app link.

✓ **Public link:** The Vercel URL is the live website link. Other people can open it.

Part J - Done, You Built It

Step 12: Share your live portfolio

You now have a real portfolio website published on the internet. This is the main finish line for the live session.

83. **Today:** share your vercel.app link with your breakout room or mentor.
84. **After class:** add the link to your LinkedIn, resume, GitHub profile, email signature, or personal bio.
85. **Later upgrade:** connect your own domain only if you already own one or want to buy one.

✓ **Main workbook complete:** If your Vercel link opens, you completed the main workbook.

Optional Polish - Only If You Still Have Credits

Everything below this line is optional. Use these only after your Vercel link works.

⚠ **Credit note:** Extra design prompts can consume credits. If your site is already live, you can stop here and improve it later.

Optional Prompt: Add My Photo

My portfolio is already deployed on Vercel.

I want to add my photo to the website.

Please guide me slowly:

1. Tell me what image file type is best.
2. Tell me where to place the image inside the project.
3. Add it to the portfolio in a clean professional way.
4. Make sure it looks good on mobile.
5. Push the update to GitHub.
6. Help me confirm Vercel redeploys successfully.

Do not change my career facts.

Optional Prompt: Make It More Minimal

My portfolio is already deployed on Vercel.

Make the design feel more minimal, premium, and clean.

Do not change my name, experience, companies, projects, or achievements.
Only improve layout, spacing, typography, colors, and responsiveness.
After editing, tell me exactly what changed.

Optional Prompt: Make It More Bold

My portfolio is already deployed on Vercel.

Make the design feel more bold, startup-like, and memorable.

Do not add fake content.
Do not change my career facts.
Keep it professional and mobile-friendly.

Optional Prompt: Add Projects

My portfolio is already deployed on Vercel.

Add these projects to my Projects section:

Project 1:

[paste project here]

Project 2:

[paste project here]

Project 3:

[paste project here]

Use only what I pasted.
Do not invent details.

Push the update to GitHub and help me confirm Vercel redeploys.

Optional Prompt: Add A New Page

My portfolio is already deployed on Vercel.

Add a new page to my portfolio website.

Page name:

[example: About, Work, Speaking, Writing, Projects]

What should be on the page:

[paste the content here]

Please do this slowly:

1. Create the page using the correct Next.js route.
2. Add a navigation link to the page.
3. Make sure it works on desktop and mobile.
4. Push the update to GitHub.
5. Help me confirm Vercel redeploys successfully.

Do not invent content.

Only use what I give you.

Optional Prompt: Add A Blog Section

My portfolio is already deployed on Vercel.

Add a simple blog or writing section to my website.

Start with these posts:

1. [paste title and short summary]
2. [paste title and short summary]
3. [paste title and short summary]

Keep it simple.

Do not add a database.

Do not add paid services.

Do not add a login system.

Create a clean blog page, link it in the navigation, push the update to GitHub, and help me confirm Vercel redeploys.

Step 13: Optional custom domain

Your free vercel.app link already works. This custom-domain step is only for people who already own a domain or want to connect one later.

86. Open your Vercel project dashboard.

87. Click Domains in the left sidebar, or click Add Custom Domain from the project checklist.

88. Click Add Existing if you already own a domain.

89. Type your domain name into the domain box.

90. Follow Vercel's DNS instructions. DNS means the settings that point your domain to your website.

! Do not buy a domain during the workshop: Buying a domain may cost money. Your vercel.app link is already a real public website.

Optional Prompt: Connect My Domain

My portfolio is already deployed on Vercel.

I want to connect my own domain.

Please explain this in very simple words:

1. Where I should click inside Vercel.
2. Whether I should use Add Existing or Buy.
3. What DNS means.
4. What DNS records Vercel asks me to add.
5. Where I should add those records in my domain provider.
6. How to check if the domain is working.

Important:

- Do not ask me to buy a domain unless I clearly say I want to.
- My free vercel.app link already works.
- Move slowly.

Troubleshooting

Step 14: If something breaks

Problem	What it means	What to ask Antigravity
Model quota reached	Your free credits may be used up.	Stop for now. Continue later when credits reset.
Localhost does not open	The website server may not be running yet.	Please run the website locally again and give me the clickable localhost link.
Website looks blank	The page opened, but the app may have an error.	Please compare the browser page with the terminal/build output and fix the blank page.
GitHub push fails	GitHub login, repo setup, or permissions may need attention.	Please read the GitHub error, explain it simply, fix it, and try pushing again.
Vercel cannot see repo	Vercel may not have permission to access the GitHub repo.	Please guide me through giving Vercel access to this repository.
Vercel build failed	The public deployment could not build the project.	Please read the Vercel build logs, explain the error simply, fix it, push to GitHub, and redeploy.
Private file uploaded	A PDF, resume, or private file may have gone to GitHub.	Please remove the private file from GitHub and explain what happened in simple words.
