Pre-Read

Session Name: Connect GitHub with n8n for Automation in Your AI Product

Table of Contents

Chapter 0: Orientation for Builders

0.1 Outcomes: What You'll Be Able to Do

0.2 Prerequisites

0.3 Setup Before the Session

Chapter 1: What is GitHub?

1.1 Why GitHub?

1.2 GitHub Key Features

Chapter 2: Getting Started with GitHub

2.1 Creating a GitHub Account

2.2 Setting Up Your First Repository

Chapter 3: Working with GitHub and n8n

3.1 How to Connect GitHub to n8n for Automation

3.2 Practical Examples: Automating Your Workflows

Chapter 4: Key Takeaways Before the Session

4.1 How to Prepare for Hands-On Work

4.2 Setting Expectations for the Session

4.3 Summary Checklist

Chapter 0: Orientation for Builders

0.1 Outcomes: What You'll Be Able to Do

- Set up a GitHub account and repository for your project.
- Understand how GitHub tracks your code changes and collaborations.
- Automate workflows by connecting GitHub with n8n.

0.2 Prerequisites

- Laptop or desktop with internet access.
- A basic understanding of coding concepts is helpful but not required.
- A GitHub account (steps below to create one).

0.3 Setup Before the Session

- Create a GitHub Account
- Follow the steps below to set up your GitHub account before the session.
- Prepare Your Workspace
- Have your laptop and internet ready to test GitHub and n8n.
- Familiarise yourself with basic GitHub terms such as repositories, commits, and branches (explained in the next chapters).

Chapter 1: What is GitHub?

1.1 Why GitHub?

Imagine you're working on a project with a group of people. GitHub helps you organise, track, and share your work. It's like a big digital file storage where everyone involved in the project can easily access, update, and keep track of their work.

1.2 GitHub Key Features - Explained with Simple Analogies

Repositories (Repos)

Think of a repository as a folder on your computer where you store your project files. For example, if you're writing a report, you put all your text documents, images, and references in one folder.

A repository in GitHub is like that folder, but for your code or project. It keeps everything organised in one place.

Commits

Imagine you're writing a document, and every time you make a change, you save it with a note about what you changed. This helps you keep track of your edits.

Commits in GitHub are like saving versions of your project. Every time you make a change to the project (like fixing a bug or adding a new feature), you "commit" it, and GitHub keeps track of all the versions.

Branches

Imagine you're writing a book with your team. Instead of everyone working on the same chapter at once and mixing things up, each person works on their own chapter in a separate file. Once everyone is done, you combine all the chapters to form the book.

Branches in GitHub allow you to work on different parts of your project (like chapters) separately, without disturbing the main project (the book). Once you're done, you merge everything into the main project.

Forking

Suppose you find a recipe online that you like, but you want to try your own version of it. You copy the recipe and make your changes (e.g., adding more spices). You don't change the original recipe; you create your own.

Forking a project on GitHub is like copying someone else's project (like a recipe) to make your own version. You can edit and experiment without affecting the original project.

Cloning

If you're working on a project with a friend, and they're using a paper notebook, they might ask you to make a copy of the notebook so you can work on it at home. You can then return the completed work to them.

Cloning a repository in GitHub is like making a copy of someone else's project on your computer. You can work on it locally (without being online) and then later upload your changes to GitHub.

Chapter 2: Getting Started with GitHub

2.1 Creating a GitHub Account

Follow these simple steps to create your GitHub account:

- Visit [GitHub's Sign Up Page](#)

- Enter your email address, username, and password.
- Choose your plan (free is fine for now).
- Verify your email address by clicking the verification link sent to your inbox.
- Once logged in, you can start creating repositories and exploring GitHub!

2.2 Setting Up Your First Repository

Once your GitHub account is ready, follow these steps to create your first repository:

- Log in to your GitHub account.
- Click on the + icon in the top-right corner and select New repository.
- Name your repository (e.g., MyFirstRepo).
- Select Public or Private (if you want to keep it private).
- Click Create repository.

You now have a place to store your code and collaborate with others!

Chapter 3: Working with GitHub and n8n

3.1 How to Connect GitHub to n8n for Automation

Learn how to connect GitHub with n8n and automate your workflows, such as triggering actions when a new commit is made in your repository. We'll walk you through a practical example where GitHub updates trigger tasks in n8n.

3.2 Practical Examples: Automating Your Workflows

We'll explore how integrating GitHub with n8n helps you automate processes like:

- Automatically notifying team members when a commit is pushed.
- Syncing your code with other platforms without manual effort.

Chapter 4: Key Takeaways Before the Session

4.1 How to Prepare for Hands-On Work

- Complete the GitHub account setup before the session starts.
- Familiarise yourself with the basic concepts of GitHub and how it helps in version control and team collaboration.

4.2 Setting Expectations for the Session

This session will focus on getting hands-on with GitHub and n8n:

- You'll create a repository, make changes to it, and automate workflows.

- Focus on understanding the integration between GitHub and n8n to simplify your development process.

4.3 Summary Checklist

Your GitHub account is ready.

Your repository is set up.

Understand GitHub basics (repositories, commits, branches).

Be ready to integrate GitHub with n8n to automate tasks.
