

AIAP C14 Day 6.2	
Question	Answer
Can we get the APIs for Open AIs extended by couple days for us to do some more practise?	Alok, the keys are available for the entire day after they are handed out. Outskill disables them to ensure everyone can use them in a fair manner.
Can Suggest me few Solution ARchitecture tools which works.	There are skills which you can use to for architecture genrally when using codex or claude here is what is mine default skill https://github.com/affaan-m/ECC#:-:text=repair%2C%20or%20uninstall-,Start%20Using%20ECC,-Start%20with%20the
what's going to happen in breakout room, if not workbook?	it's all q/a in the breakout room
When is hackathon happening?	
yes	
i have a question regarding wispr flow. can i ask here?	is its a subscriptions question you can write to support@outskill.com either raise one more question.
m already working on the idea for a wealth management application and kind of a wealth management portfolio. Think about it. If you have any options, you can show us how we can get started with this. Also, which is best: an initial website or an application? Which is the best option, and what will be the procedure or the tools for hosting and deploying?	You will learn how to get started with this and do all of this in the course. My recommendation is, complete the course and it will help answer almost all of these questions!
how to add paul bettany's voice to jarvis	that would actually make it sound more original I think it all depends on the Voice ID used from eleven labs.
Excalidraw is paid, right? Do we have any alternative free options?	It is free unless you require team collaboration. If collaboration is essential, FigJam by Figma is a better option.
Also, where do we have ask AI section here?	There is a Ask AI Companion on the right of zoom if you have joined from desktop looks like a star.
can we get recording for last workbook session, i could not attend that?	Workbook sessions are not recorded, but each workbook generally has a recording where the workbook is solved. You can use that to follow along.
Is it plain text or .md file to proper explanation	It can be either. However md files can add things like structure, diagrams, emphasis, etc better than text files. We generally work with md files.
Can we SKIP n8n completely in that case	Not completly N8N helps you connect a whole lot of apps and build systems where vibe coded apps mostly is focused on 1 specific function.
What does MVP stand for?	Minimum viable product. In short, a product which does one thing well for your core audience, but does not have extra features. It is how we test whether an idea will work or not, and whether our audience would use it.
will there be some information about DUNS number, and how to launch these apps in playstore or appstore?	I think this session is all about webapp mostly.
ok thanks	
can i get the link for last workbook ?	Can you check you LMS or just write to support@outskill.com for the access
Hello, we are supposed to cover codex yesterday but we didn't. Will it be covered on another day of our programme? thank you!	can you write to support@outskill.com codex is a app which you can use to build apps and software you can use same concept which you will be learning here.
if i need more information about the launch? is there some method that i can help ?	Launch of a webapp or general software development approach ? you can checkout this resource its a skill which helps you to define the approach of building https://github.com/affaan-m/ECC#:-:text=repair%2C%20or%20uninstall-,Start%20Using%20ECC,-Start%20with%20the
The whiteboard and materials for vibe coding will be provided, right?	Yes, whiteboard are generally added.
Will be create zarvis today?	This is scheduled for tomorrow.
Can you also share how to monetize the apps and what all platforms we can use	This will come up in an upcoming session.
can we also get some guidance on high quality backend configurations? putting together a nice front end is very easy, making it work in practice is the problem	Absolutely Rohit. This session and many of the upcoming sessions will give you the right knowledge to do this well. The main thing here is to ensure you know what your product does, how it should work, how it should do things, what all users will need, etc. The more clarity you bring, the better will be the backend build by AI for you.
are Vibe coding and GitHub Copilot used for the same purpose ?	Github copilot is a harness for using models so you can build stuff same like codex or claude vibe coding is the process you seeing in the session how you build software & apps
HI Harshith - Please explain about MVP, MCP where it is used which situation ?	MVP is Minimum viable product. In short, a product which does one thing well for your core audience, but does not have extra features. It is how we test whether an idea will work or not, and whether our audience would use it. It is in no way related to MCP at all.
HI Harshith - Please explain about MVP, MCP where it is used which scenario ?	
yes	
will this session recording be available ?	yes
Lovable use which LLM?	Mostly Claude Models but also Gemini both goes hand on hand as Gemini is good with frontend and OCR where claude models are great with developement.
Should we also opne Lovable, or just watch?	Please just watch! Every single thing we do is important to understand. Once you understand this, you can use any tool to build.

Can we use claude or codex to vibe also. is there any difference.	Absolutely. There is no essential difference in how they work, and these tools actually use the claude and chatgpt models underneath. The main difference is that these systems have made it a little easier to get started by incorporating things like database, hosting, payments, etc directly into their systems.
Emergent vs Lovable? What is good for what?	Lovable is ideal for non-coders who want to build beautifully designed web applications and simple prototypes very quickly. Emergent is better for building complex, full-stack systems because its AI team plans, tests, and deploys both mobile and web apps.
which is the best platform among all?	getting started lovable but as you scale up base44 its all depends on your usecases.
what does loveavble specialize in?	Building MVP WebApps is something loveavble does exceptionally good.
jwhat are these tools all about? building dashboard?	Building Functional Webapps.
will this session recording be available ?	Yes, all sessions are recorded and available within 12 hours at most.
thanks	
Would you say ChatGPT sites is a vibe coding tool?	Well, not completely vibe coded, but since they have unlimited access to the models, most of the code is essentially vibe coded.
Lovable mentions its 100 monthly credits how does this work ? can throw some light ?	The Lovable Pro plan includes 100 monthly credits that act as a unified currency across the platform. Every action you take—such as generating new code, publishing an app, or scaling infrastructure—consumes a fraction of a credit (typically 0.5 to 1.2+ credits per prompt depending on complexity). These credits also cover the server and database hosting costs for your live apps, any unused credits roll over to the next month, and you can buy on-demand top-ups if you run out early.
Lovable develops only UI/UX Part of it right what abt backend and dB ?	Lovable can do everything, including backend and databases. However, it can only build MVP level products, as it can hit context limits at some point.
thanks	
Can everything be integrated via prompts or there needs to be connectors added here	Prompts alone cannot connect external tools to your AI assistant. You must add dedicated connectors so the AI can securely interact with outside apps and data.
Can we move half done work from one app to another app	Yes, this is possible as they all sync work to github. You might need to provide some context, as well as ask the new app to explore the entire codebase before starting.
will it understand ?	
connectors	
API Services will be automatically created ?	Developing over lovable yes most API services will be taken care off.
backend and database shud b same	Not necessarily Geeta. Any services which process data or run other processes are part of the backend, but independent of the database.
can these be hosted on hostinger or any external sites after we develop	Yes, that is definitely possible to do. They all put the codebase on github, and you can then use that to publish anywhere you need.
ok this can be integrated with github and shared across within a team to develop each component	Absolutely. They all put their code on github.
is it similar to node.js?	No, Node.js and Next.js are not similar; they serve completely different purposes in the web development stack. A common analogy is that Node.js is the engine, while Next.js is the car built using that engine.
Can you impose next.js to a wordpress website? To improve AEO/GEO, conversions etc?	No, wordpress works very differently, and you cannot use next js on it at all.
Why are the LLM's more trained on NextJS.. Thank you....!!	so react is the largest javascript library so most of the repo out of react is something LLM's are widely trained on.
But we did not use Node.js in the workbook yesterday though, just downloaded it.	Yemima, node js is used by Claude in the background to run mcp servers many times. Without it, a lot of times, custom mcp servers don't work properly.
what is nodejs, i wasnt able to attend yesterday?	its helps you to run JavaScript on you computer most of the web browser and webapps runs node js here is the way you can install this https://nodejs.org/en/download#:~:text=Or%20get%20a%20prebuilt%20Node.js%C2%A2for
Langchain and Langgraph can be used ?	LangChain is a tool for building simple, step-by-step AI apps, while LangGraph is an extension that lets AI make decisions, remember past actions, and loop back to fix mistakes.
Understood, Ritesh, thank you.	
Can we integrate with Oracle or MS SQL?	Oracle would be an ERP and not a database. But yes, you can use MS SQL. However, you would need to use either Claude Code, Codex or Cursor to build with it. Vibe coding tools like Lovable would not let you use it.
why is there a diffrent coding language for backend anf frontend?	The backend runs on a cloud server or local machine, while the frontend runs in the browser each serving a completely different purpose.
Great with the big red arrow. Maybe you can ask the rest of the presenters to do this as well, for comming days. Easy to see. Thanks in advance!	
Supabase and Next.js are both open source, so we can build an app without paying anything, right?	You can launch your initial web app at no cost, but as you scale users and features, you will need to pay for hosting, database costs, and other infrastructure.
can you give a lil more explanation about NODEJS	node js its helps you to run JavaScript on you computer most of the web browser and webapps runs node js
What could be database in this case ?	supabase is the database we will be using in this session.
google ai studio can build any website or windows app eaisly. then how these all are different from ai sudio.	Google AI Studio is locked in with Google Platform so you will only be able to use that app in Google AI Studio Good for a MVP but this what we are learning here will help you to expand out when you want to scale the app for more users and features.

could someone sum up in like a para what happened in last 30 mins my laptop battery was drained out and i would get better understanding if i know the jist	Harshid kicked off the session by defining vibe coding: prompting AI to build products without traditional coding through a continuous cycle of prompting, generating, reviewing, and refining. He outlined a core tech stack featuring Next.js, Node.js, Supabase, ShadCN UI, and TweakCN for accessible, scalable app development. Using Lovable, Harshid live-built a Personal Productivity CRM Dashboard, demonstrating the importance of switching to plan mode before building. The cohort brainstormed several high-value features, including task management, expense tracking, calendar integration, and a voice-powered AI assistant. Lovable then structured these ideas into a three-phase rollout plan, concluding the demo with a live preview of the functional base dashboard.
https://chatgpt.com/share/6aacb558-22bc-83ee-83cf-eb170d561526	
Pls show linkage again	
Pls show linkage again	
will there be a session to develop similar kind of project using codex or claude code ?	No, claude code and codex can get more technical to setup and use for coding. They also need premium subscriptions to work at all.
where did we copy this codew from ?	
what was this website about ?	
can I build my own stock market dashboard linking with my portfolio and the dashboard updates live , depending on the market and gives me tons of other insights.	Yes you can build some sort of that you will need a dedicated API specifically for tracking financial stock market data. or connect to MCP of Kite by zerodha or IND money which can get you access to financial stock market data.
can u summarise this once? the steps	
will you also advise how to ship the product to customer/end user?	
Will this calendar be linked with the Google Calendar on it's own?	Well there are connectors over lovable so yes it will link just you need to prior add the Google Calendar.
Can you please explain the "React"?	React or reach.js is javascript library which helps you build User Interface a lot of platforms like netflix, facebook & Airbnb rely on React. also it given rise to other libraries like next.js or shadcn as we saw in today's session.
how much lovable credits used for todays activity ?	will get to know towards the end of the session.
Do we need a Paid Lovable platform or can work on free version?	This is lovable paid version but you can get stuff done using the free lovable too the things is it will just constantly hit the limit.
but so does lovable?	
Can we use Antigraivty to build all this?	Absolutely one on the best apps for vibe coding just make sure you install Antigraivty IDE so you can also review the code it changes.
Can't we give lovable to use TweakCN instead of ShadCN since TweakCN uses ShadCN already	
How to align design themes and component library with organization specific design system elements. Till MVP/Proof of Concept it is fine, but when we are constrained to use organization specific design themes and components, how to go about with that with minimum re-work?	
Once we build the CRM in lovable, can we use it in daily base? Since it is already fully built, it should not cost any token, right? But the hosting will cost something, I guess?	
How did we connect SUPABASE account to the LOVABLE platform? .. Was it already done before we started working on the dashboard. Same for ShadCN and TweakCN?	This is something which lovable can do on its own. You just ask it to add a database, and lovable will set everything up.
Suppose I am building an enterprise level application with multiple users aggregating data and I see it on my dashboard would base44 be an ideal choice given claude code and codex can get technical?	For enterprise grade systems, I would not recommend one of these vibe coding tools. You would ideally need to move to Claude Code or Codex.
WILL I BE ABLE TO MODIFY AN EXISTING WEBSITE AND CONVERT IT NEW ONE USING THIS VIBE CODING METHOD ? IF YES, HW ??	No, sorry. That would be extremely difficult unless you have the entire codebase for the old website available. Even if you do have it, you would have to use Claude Code, Codex or Cursor to do this. Tools like Lovable cannot do this.
for free? It does not need the account which SUPABASe account it needs to use?	This supabase is included in the Lovable subscription price. You don't need to pay for it separately.
same for shadcn & tweakCN?	Yes mostly same as both are based out of React.js shadcn didn't supported lovable so we move to tweakCN
Can you help us with the instruction / workbook for this exercise? it will be very helpful....	Over the Q&A please ask your doubts we don't have a step by step workbook as vibe coded app uses cases should come from you.
What about website security and testing	lovable will overall takes care of security but testing is something need manual checking each feature and button individually.
While doing Vibecoding, many times we need to rollback to previous output, to redirect to correct direction if we observe deviation after a certain point. Do we have a checkpoint concept within lovable to rollback to specific saved version.	Yes, all these tools have systems like this. To make this more robust, you should enable github which is the enterprise grade system to do this.
organisations generally use SQL database, can we use it here	Supabase is a postgresql database. So it is an SQL daabase actually.
ShadCN is supported i guess .. we used command to specify which dashboard we want to use and then also specified tweakCN command to beautify with theme	
missedt the last 15 mins post break start. could you give. a summary of what is being discussed	
so a similar working style and workflow would help me build in codex?	
would it support shadcn and everything?	as we saw ealier in demonstration that shadcn was something which didn;t worked with lovable the alternative choosen then here was tweakcn. which is pretty similar

A step-by-step written guide would be so helpful. Will we get one?	You will have the recordings will advice over Q&A please ask us questions vibe coded webapps are something depends on your use case.
Jarvis is name fr voice assistant ?	
If I wanted, I could create a MCP of this dashboard and use n8n workflow to incorporate in my Claude, right?	
Do you have link for website design template	
Am not referring to the use cases. But the approach , the instructions - similar to the other workbook would have been helpful..	
Can we integrate bank accounts?	
See if a step by step work can be facilitated... it will be appreciated	
Or I mean, not even an MCP. Just after its hosted, create a workflow in n8n for interacting with this and add to Claude?	You might not need n8n at all. You can get the Claude app to connect directly to the Supabase database and interact with all the data directly.
1	
1	
I think Next.js hadn't worked because we did use Shadcn and tweak CN both. Shadcn for the dashboard and tweak for the design	Daksh, these are design systems which are used for creating UI elements. The programming language underneath is Next.js.
What system to use to control the website with hand	
Are we also going to learn how to offer our products with the best price?	
I understood that, I just needed clarity to what Shahswat had told where he told Shadcn hasn't worked in the demonstration being done.	
From where its getting the API key?	
Tokens are used only while building an application or even while running an application after launching	
Any connectors used in Lovable? When referencing Next or Node or Supabase?	You don't need connectors for this as these are in-built in Lovable. But Lovable has a lot of connectors, like connecting to Stripe for payments or Eleven Labs for voice.
Can this be converted to an iPhone and Android app?	This is not possible inside Lovable. But you can take the source code, give it to Claude Code or Codex and they would be able to build the app.
Can I build on Claude & build the rest on Lovable?	If you are choosing to build on Claude you can build everything natively over Claude itself.
HW CAN WE USE SOURCE CODE WHICH HARSHITH WILL SHARE FOR THIS CRM ON GITHUB AND BUILD ON TOP OF IT?	Yes, you absolutely can.
What kind of tasks Jarvis will do here?	
What plan of Lovable would we need to subscribe to - to be able to build something like this. Also since it uses ChatGPT for making Jarvis, I would need paid ChatGPT as well?	The minimum you would need is the \$25 plan. But you may need more credits than that to build everything in a single month.
So there is a recurring cost to run this model for Gemini and OpenAI, right?	Yes Lovable does charge you based on LLM usage doesn't specify the model but its Claude and Gemini.
Why do I need dashboard token when I host this GitHub code?	
Is it possible to only prompt for creating API keys and use them for connecting different tools and models for creating a new App?	
Are tokens used only while building an application or even while running the application after launching?	On Lovable, tokens are used for building as well as services like database, hosting, AI, etc. So after launch, tokens are needed for all the other services.
What is the cost of running this dashboard?	This session and usage of the LLM's will be shown at the end.
Have we giving all chat GPT or Gemini access to Lovable already	Lovable doesn't gives you which model are used but its mix of Gemini and Claude under the hood.
The end result of this dashboard will be this in the form of a Website or an App that can be installed on a mobile; or both?	
As a Coder myself, being in world of Vibe Coding, what advantage do I have? Like of course I love I can ideate more than to code, but non-coders can also do the same. What edge can I bring on me to be ahead of everyone today?	Your ultimate edge in Vibe Coding is the ability to act as a Technical Director rather than just an ideator. While non-coders can describe what they want, you possess the deep structural knowledge to guide AI with precise architectural vocabulary, spot hidden security vulnerabilities, and diagnose complex runtime bugs that trap others in infinite prompt loops. You know how software operates under the hood, allowing you to seamlessly audit the AI's output, manage technical debt, and scale code into production pipelines where non-technical builders hit a wall.
Can u talk about hosting this CRM GitHub code. I understand that I need API for open AI and the token. but why tokens for the dashboard?	
Please tell me the exact cost of end-to-end whatever we have built today with Harshit so far, and what would be the potential cost of such a website with all these features and integrations if we want to make it public. The point is, I just want to understand how much cost is involved before making it public.	
Who is the audience for this fictitious dashboard? Is this a demo of Harshit creating a dashboard for the fictitious client?	Yes Wendy, this is a demo. But we could easily customise this for a real client and a real company.
If we would build for the whole company of like 60 employees, how the approach differs?	
What is real time api?	The OpenAI Realtime API is a tool that allows software developers to build instant, live voice conversations into their apps. It is the underlying technology that powers things like ChatGPT's "Advanced Voice Mode," allowing people to talk to an AI smoothly and naturally.
During the morning session, Matt said that the voice agent works by taking the user voice, convert it to text and then process it using AI and then generate text and convert it back to voice. And all of these processes took only 1 ms. Why this did not work in this case?	Yemima, this is because Lovable used older technology to build this. This is exactly why Harshit is reprompting it and getting it to improve this.
To be clear, what is the pretend use case for this demo, specifically?	Yes, this is a pretend usecase. We can't build real products in one session.

and then it charge combinly after using all chat gpt or could be. correct?	
can we add whatsapp and tell jarvis to reply	
is the process different for google workspace integration than personal gmail?	Yes, you would need to enable Google APIs for workspace most likely.
Please also cover the deployment and hosting aspect.	
which model used by lovable for these integration?	
How can we use Lovable to prototype new modules in an existing Web Application to be consistent with the application and to follow the same structure, CSS and UI styling	
do we have breakout room for this session?	
how do you impliment these api keys on lovable?	
How ownership works for these website?	
can we customize the dashboard url?	
If we would build for the whole company of like 60 emolyees, how the approach differs?	
Is it mean we can create API key in open AI & can use any where is it?	Yes, you can go to platform.openai.com to do this.
Can we rename the website?	Absolutely. You can do this very easily.
once the final product is ready and later if any of the tool - supabase/lovable etc closes /stops support - will the product still work?	
What I need to do to do that?	
do we have breakout room for this session?	
how to uplaod on git?	
How do we host this through a different domain ?	
cAN YOU BUILD ALL THESE ON GOOGLE	
I WHY DID WE GIVE THE API KEY AT LAST STEP ?? FOR VOICE AGENT >	
if i wanted to refer to realtime website for flight booking for automation then how do i do it should i list the sites as reference and interate them to the dashboard?	You would need to find a website where they have APIs available. You can thn use that to integrate it,
How to deploy a product (e.g. a fully built web application) - outside of Loveable environment	
Thank you Harshit for the great session	
I was to develop new modules using Lovable for my existing Web App.How can I approach so we re consistent with the application and to follow the same structure, CSS and UI styling	
Can you guys show/tell us how to implement the next phase / or another phase as this dashboard was made in phases	
How long is this session today?	We should end between 8 and 8:30 pm IST.
usaully these website will provide the API key ?	Not all of them Padmaja.
can someone show how to implement into a website	
if i have missed some chunk can i attend it on any other session so that i dont have a backlog ?	
thanks	
Due to interenet issue, i got logged off and reconnected. now unable to go to my breakout room which is done by shaswant singh. pls help me in rejoining	
where can I get the reflection links for past sessions?	
How do I create educational videos for my customers, especially technicians in different languages, using web-sourced data on battery maintenance, warranty, SOPs for newcomers in our plant, and other procedures? I want podcast-type, animated, and other educational videos.
