

AIAP C14 Day 7.2	
Question	Answer
what ai i use to chnage my audio to text	You can use deepgram for Audio to text. Or use Transcription option from Open AI and even Gemini I guess
10q	
we can create this workflow in chatgpt why we need n8n	chatgpt? Using what in chatGPT?
llm	
Are there any speech-to-speech tool in n8n for my agent?	Do you mean speech to text? If yes - n8n does not have this built-in, but there are several speech to text apps - OpenAI, Deepgram, Gemini, Elevenlabs
Are we supposed to create this along with Akhil?	No, you need to only watch the session right now. We will have a hands on breakout room with a workbook after this.
i can create this workflow in chatgpt	Yes, you can create this kind of Agent on ChatGPT, but this AI Agent workflow can be connected with apps such as WhatsApp, Telegram, Slack to receive triggers and send reply. ChatGPT does not have these triggers built-in.
Will we get this json file?	Yes, it will be shared.
During 3 days masterclass, Vaibhav's Jerry could make phone calls and told that we will build this Jerry. But it seems we building an another simple n8n workflow that has Gmail and Calendar access and calling it Jerry. How can we add phone call feature?	It's possible to allow this AI Agent to trigger a phone call. You have seen how RetellAI can trigger a phone call. RetellAI has an API to trigger a phone call and this can be integrated with this AI Agent to trigger phone call.
fast model	
Why not start with AI Agent?	You can start with an AI Agent, but defining the input and desired output first makes it easier to choose its tools and test whether it works.
got it Jitesh. clear. Thank you	
Does Openai require API key to activate?	Yes, you need to provide OpenAI API key to use it as a Chat Model for an AI Agent on n8n
How long does the memory last for? For example, if you set context window to 5 and ask one question on one day then asked a new question the following day, is that the second message or is it classed as a new one starting at first message?	Memory does not have a time expiry. So, even if you come next day, it will still remember it. It has a session based expiry only. So, remembers last 5 messages even those are months old.
yes	
So 5 questions in 60 seconds will lose memory with more questions and the same thing happens if 5 questions over a month?	that's correct.
How are new sessions set?	session is set per Session Key ID. And, based on this unique ID, it starts a session.
Ok, but what I am asking is if I ask a question on sunday for the first time, its starts a new session, if I ask a second question on Monday, does it start a new session? Or is it that after 5 questions, a new session id automatically begins?	No, it does not start a new session if the Session Key ID on Sunday and on Monday was the same. Even after 5 questions, there's no new Session ID, it's the same, but it remembers the last 5 only, anything before that is disappear from memory. Session Key ID is a unique ID per user. Example - their phone number or email.
Ok, but what I am asking is if I ask a question on sunday for the first time, its starts a new session, if I ask a second question on Monday, does it start a new session? Or is it that after 5 questions, a new session id automatically begins?	Oh, btw - Session Key ID also depends on what chat platform we use. For n8n's chat trigger, the new session is started everytime you start a new chat.
If you give the specific email to your boss, is that not enough?	If you mean giving the agent your boss's email address, that identifies the recipient; it still needs a connected email tool to send the message.
Is the context window depends on the brain?	Context is stored in memory. Will be clear once he explains with example.
How can we trigger this n8n workflow (Jerry) from Claude mobile/desktop App?	Expose the workflow as an MCP tool in n8n, then add its authenticated remote MCP URL as a custom connector in Claude. Once connected, Claude on desktop or mobile can call the workflow.
Is there a numerical limit to the context window length for mini model?	Yes, memory will have a limit that we set. Numerical.
Dear jitesh now i have 14 day free plan to keep using n8n how much minimum we need to pay every month. pls guide.	On the n8n cloud plan, to keep it active, you need to pay about 24 euros/month. Or -you can self-host at a cost of about \$6/month
Is there a limit, in general, like an average limit for the context window for mini model? Not regarding the workflow, just in gnerall	there's no limit, but if your context window size is high, it consumes more tokens and might be slow.
s it like an identification number? session id	Session ID is unique identifier. If you are using WhatsApp or telegram then the identifier could be your phone number.
Will we learn about self host n8n later?	this may not be covered, but there should be a resouce on the LMS for this. You can also refer this - Setup n8n for free on local computer - https://www.loom.com/share/71398561cfa947b28ee18893345f1959
If we share jerry with other users, how do they authorize their e-mail?	Each user needs to authorize their own Google account, and the workflow must use that user's Gmail credential. Sharing the chat link alone does not set this up.

Jitesh, could you send the screenshot of complete workflow? it looks interesting.	https://n8n.io/workflows/8500-jarvis-productivity-ai-agent-for-tasks-calendar-email-and-expense-using-mcps/
https://cdn.uploadtourL.com/Screenshot_2026-09-20_at_4_15_42_PM.png	
Can we add a function in the chat interface to be able to recognize my voice	Yes, add microphone recording and speech-to-text, then pass the transcript to the same agent. Recognizing your identity from your voice would require a separate voice-verification feature.
amazing thankyou Jitesh	
Will the addition of voice cost more token?	Adding voice will require you to transcribe voice to text first and then send that to the AI Agent. So, slightly more tokens/credits for voice to text transcription
And is Jerry equivalent to Gemini connected to Firefly.ai MCP?	Jerry built on n8n will provide you more flexibility. You can choose your own model, choose your own chat platform (Telegram, WhatsApp, Slack) Gemini does not offer such flexibility.
Is there gonna be a workbook in the end of this session ?	Yes, we will cover the same workflow on the workbook
SHould we specify system prompt with info such as who boss is? Etc?	Yes, adding this on the system prompt will improve the quality of the AI Agent.
What was the trigger again?	Chat Trigger - This is n8n's native chat interface.
wow i wish i had started earlier	
How would it know the boss otherwise? Is it going to scan lots of emails looking for some sort of context or clue?	without that it would not know. might get into the loop of scanning, or might just say it does not know.
do we have any single tool which covers all operations?	No, but MCPs can cover multiple operations at once. You can create or use an MCP and use that MCPs for all these operations at once.
i seem to use too many tokens and keep exhausting	
Can you explain more about trigger since I do not understand that one	A trigger is the event that starts a workflow, such as a new chat message, an incoming email, or a scheduled time. It passes that event's data to the next connected step.
Why an LLM after the trigger?	An LLM is placed after the trigger to read, understand, and organize incoming information before taking action. It acts as the intelligent brain that decides what the data means and writes the exact response needed
Will we get the json for the Harry demonstrated during bootcamp? This is not the same...	We will build this same workflow during the breakout room.
why switch is not working in this workflow?	Check the actual input field, value, and data type against the Switch rules. If nothing matches and Fallback Output is None, nothing continues; use Extra Output to inspect unmatched items.
Does that check of availability for the dentist appointment procede with an email that is requesting an appointment?	It can do that after you add calendar tools. Akhil will show it shortly
So the trigger in this workflow is that an email comes in ???	No, the trigger for this workflow - "When someone sends a chat message"
cannot we make a email agent output as input for calender event	
A chat message (in my opinion) can not be the trigger to start checking my boss email. It does not make sense. So what kind of chat do you actually mean it is?	Chat Message will be the trigger that will trigger the workflow. This is a chat interface that n8n provides. Whatever you send in the n8n chat interface goes as an instruction to the AI Agent that will check your boss' email. We're using n8n chat to quickly build our Jerry Agent. You can later replace this n8n chat trigger with a trigger that can be "a message received on WhatsApp or Telegram"
Does this mean that the memory of the master agent needs to have more context window then because it needs to distribute the tasks to subagents?	Not automatically; the master mainly needs the goal, routing rules, and relevant subagent results. Keep results concise and increase retained history only when the task actually needs it.
Could we have connected - Connect Calendar Agent -to- the Email Agent. As email can ask calander to book event. Vice versa is not required	Technically it can, but it's still better to have one master orchestrator agent that handles all the sub-agents.
We can add multiple AI agents to Master Agent?	Yes, we can.
CAn you send a picture of the chat interface in n8n ?	https://cdn.uploadtourL.com/Screenshot_2026-09-20_at_4_50_58_PM.png
We could crate all this stuff using cloude by prompt. correct?	Yes, it's possible to do. But, it consumes tokens and might make mistakes.
If I connect my Gmail and Google Calendar to Claude Cwork or ChatGPT (Work), they can usually take similar actions (I think???). How is that different from configuring n8n?	You're right, but this agent is far more flexible. You can set your own pre-defined prompt, set your own triggers such as message from Telegram, Email, WhatsApp, Slack, etc. Cwork/ChatGPT do not have such triggers built-in.
Hey, I think we will be clear on this edited workflow automation in the next 1 hour, when the entire functionality is achieved, right? I have a quick question. In the earlier calls, we were shown the Jerry UI, right? There was a chat application, also sort of WhatsApp-like, where we can chat with Jerry, and then all the details were being shown in that. How will we be able to do that integration for this entire workflow? How should we go ahead?	For a similar chat UI, use n8n's Hosted Chat or connect its chat widget/custom frontend to the Chat Trigger's Chat URL. Each message runs your workflow, and the agent's response appears back in that interface.
what is the difference between system message and user message	System message = permanent instructions (role, rules, tools). User message = the live request, different each run. In Jerry, the system prompt tells the orchestrator how to route. The chat input is the user message.
do we only ask the agent to create or book an apointment or we can use simple english and as the agent to schedule. can it automatically choose the create option	Yes, you can say 'Schedule a dentist appointment'; with clear tool descriptions and the calendar tool connected, the agent can choose Create Event. It should ask for any missing date or time details before booking.

I do not understand that picture. For me a chat is a chat in whats app, text message or in a chatboat. That is maybe I do not understand this since I have the wrong picture in my head of what a chat is.....can you pls explain with exampls what kind of chat it could be?	Yes, you are correct. To build quickly, we're not using an external chat app (such as WhatsApp or Text Message) We're using a rather simple one first to build the core AI agent first. This AI Agent can later be connected to WhatsApp or Slack or Telegram.
Got it - thanks Jitesh. How can we connect whatsapp here to trigger the agent? that would be crazy	WhatsApp can be connected. It just requires you to do some long set-up on Meta. Not hard. Just tricky. Can be done.
10 minutes break	
i wanted to see an visual agent just like on phanis desktop how do we get to create them and what all things do we need	For a visible desktop assistant, build a desktop/web interface and connect it to an agent backend such as your n8n workflow. Add an animated avatar and speech-to-text/text-to-speech if you want a character that listens and speaks.
But how could I trigger the workflow when it is my agent, that is what I do not understand?	With a Chat Trigger, open your agent's chat box and send 'Summarize my unread emails.' Your message starts the workflow, and the agent then calls the connected Gmail tool.
10 minutes break please	
Hi Harshit,	
Thanks for your guidance on what I can use to build the chat UI. I have a couple of follow-up questions: How can we turn this into a full-fledged application where I can enter prompts by voice command (which Akhil currently does manually), and also have the option to type them in a chat? If I want to give multiple team members access, do I need to build a website using Laravel, as you showed yesterday, or can this be done in n8n itself?	Use n8n as the backend and add a chat interface with text input plus microphone recording and speech-to-text. Laravel is optional; basic team access can use n8n's authenticated chat, while a custom multi-user app needs its own sign-in and per-user connections.
i have still not had my introduction call. how do i connect to all the applications with the passwords	Connect each app through its n8n credential setup, using the required OAuth sign-in, API key, or other supported authentication, then select that credential in the app's node. Keep passwords and keys out of the agent's chat.
A visual agent who can do similar tasks ...can we integrate the image WITH THE WORKFLOW FROM N8N	Yes, display the avatar in your app and connect the app to n8n through a Chat Trigger or webhook. n8n runs the actions, while the app animates the avatar and uses text-to-speech for spoken replies.
Thanks @harshit will that be a part of upcoming hacakathon	
I can do all this in Claude with Connectors. How do I decide when to use Claude or when to use n8n workflow?	Claude with connectors may be enough for tasks you want to guide interactively; choose n8n when you want explicit triggers, fixed steps, branching, and a reusable process. They can also work together, with Claude calling an n8n workflow.
how can we add multiple email accounts as you know we all have many email accounts	Add separate node with a different credential
sorry i mean for the subscriptions	
back	
under the same email agent	Yes, connect multiple Gmail tools to the same email agent, each with its own account credential and a clear name. Have the agent ask which inbox to use whenever the request doesn't specify one.
If i want to connect my Jerry with linked in, Instagram, Whatsapp & youtube how many master agents will i need to create or one master agent with better ai model ?	One master agent can coordinate platform-specific tools or subagents, each with the required API access and credentials. Add specialist agents for distinct jobs, and choose a stronger model only if the task complexity or test results justify it.
How to add a workflw before agent responds to a mail, workflow may relate to any process say some excell modelling, and respond outcome of model in the mail response	Run the spreadsheet/model calculation first, ideally in a dedicated sub-workflow, then pass its result to the email reply step. Wait for the calculation to finish successfully before drafting or sending the reply.
We understand that for teaching purpose its best to built the agent from ground up and we wont be able to built an extensive agent in the class. So, In the end, would it be possible to show the system diagram of actual jerry, so that we at least get an idea of all the components that make jerry jerry. Baccuse as far as we undertand Vaibhav's jerry is very extensive. If its proprietary knowledge, we understand, but in that case could you atleast list out all components and features that have been configured into it?	We will be building this entire Jerry in breakout room.
if i host n8n in my local computer then the automations will stop if my machine is off. is that fair understanding? if yes can i use google cloud to host?	yes, you're right. You can host on Google Cloud so it can run 24x7
ok great... thanks	
can we use different llm to different agents	Yes, configure each agent with its own supported model connection and credentials, then choose models based on the job, cost, and quality you observe in testing.
if i have to run an automation to find relavant jobs in linkedIn, can mcp connector be used to use linkedIn as my job search and apply tool within an AI agent in n8n? if thats not the case, how can i run automation in linkedIn like find jobs, apply to them and cold/warm outreach	Only if the MCP server supports those actions and has the required LinkedIn access; n8n's built-in LinkedIn node only creates posts. Start with job-alert emails feeding n8n for matching and tailored drafts, then review before applying or sending outreach.
How can i send jerry to attend meeting (Microsoft Team, Zoom) and participate actively based on email, calendar and project document access (RAG). Please explain the architecture/ implementation in detail	Use a Teams/Zoom meeting bot with live audio permissions, connected to speech-to-text, an LLM that retrieves authorized email/calendar/document context, and text-to-speech back into the meeting. Let n8n handle scheduling, retrieval, and follow-up actions; the meeting bot handles live audio and turn-taking.
Can you use n8n with Outlook the same as gmail? Same functionality, write, move, delete e-mails etc? Or how can you use n8n with your own domain?	Yes, n8n's Outlook node supports drafting, sending, replying, moving, and deleting emails. For custom-domain email, connect the actual mail provider: Microsoft 365 through Outlook, Google Workspace through Gmail, or another provider's supported API/IMAP/SMTP integration.
will we do this entire workflow in breakout room	Yes. we will do it.
why did askil say about blank output from fireflies. we need to have something already.	Yes, a transcript query reads meetings already available to that Fireflies account; it does not create a transcript. If there are no accessible meetings matching your filters, the returned list can be empty.

Can Wispr flow work for transcripts too?	Yes, Wispr Flow's Notetaker can record meetings and produce transcripts and summaries on Mac or Windows when enabled for your account. Regular Flow dictation converts your speech into text in the app you're using.
Why not use MCP insteadof API?	If MCP is available we can use it too.
Missed the start of this session after the break. Is he needing a custom mcp first for fireflies because I saw he mentioned curl command and api, if so, is this because there is no native fireflies tool inside n8n?	He is using http tool to call api of fireflies
Are the connectors in N8N unidirectional ? if yes, how will information from Gmail Tool go back to Master Agent?	In that way, it's not indirectional. Sometimes it's bi-directional. Like Gmail tool data going back to Master agent. But otherwise, generally data travels from left to right, mostly.
why cant we use Fireflies app API key rather than the transcript API ? If we use Fireflies API we can do all the functions we need to do with related to Fireflies app ? Also can you explain the difference between using both the API Keys?	We are using the Fireflies app API key itself. There is nothing called a transcript API separately. Using the Fireflies API key, you can also do other functions related to the Fireflies app, as long as the API supports it.
Thanks Harshith, could you also share the site you had shared in the breakout room, where you had curated documentations, playbooks for us?	
Can you show one more time about fireflieshow you have connected to n8n tool	
Is api calls for fireflies free or is that only available on paid plan?	it is free
I have been trying to connect my Firefly with all these Zoom meetings that we have every day, but it's not able to connect. There's an option for capturing notes, and whenever I click on it and provide the meeting ID, it just says that Firefly has to be 3 minutes in the meeting to start capturing. right? It's not happening. On the other hand, I can see that for the mentors, Firefly already has the entire schedule from Gmail, and they automatically take notes. How is that possible, and what am i missing?	
I am not sure that I totally understand the difference between API and MCP, when to say something needs to be connected using API or MCP.	An API lets your workflow call a service directly; MCP gives an AI agent a standard way to discover and call tools, often backed by APIs. Use MCP when a suitable server exposes what you need, or call the API directly for precise control.
Most of the organisations have MS copilot for meeting notes, Action items and transcription. is it that fireflies has more capability that we are using it or it can be used interchangeably	Their note-taking features overlap, but they are not interchangeable API connections. You can replace Fireflies with Teams transcripts through Microsoft Graph if your organization allows access, then adapt the workflow's data retrieval and field mapping.
so we have to connect fireflies to google calendar?	Connect Google Calendar inside Fireflies if you want it to discover your scheduled meetings automatically. Reading transcripts already stored in Fireflies is a separate step: n8n uses the Fireflies API key, without needing a Google Calendar node for that request.
Why can't one API retrieve both the meeting ID and content?	It could, but you'd be loading every transcript to find one. The list call is light: IDs, titles, dates. The agent picks the right meeting, then pulls only that transcript. That's cheaper, faster, and more accurate.
when using Fireflies API (Curl command) where is these meetings defined(source) - it was events in google calendar right did we give the source to read from in the API configuration? or configured somewhere ?	Fireflies is a platform that actually joins your meetings on your behalf and records to transcribe the call. Hence when you connect fireflies, it can retrieve your meeting content. It can be connected to Google Calendar or Outlook as well.
Why not use the Fireflies node for this in n8n?	Node and tool are different
Could the trigger be a new fireflies meeting recording being completed? Use case - Have a meeting that fireflies is recording, as soon as recording is stopped (as meeting is over), n8n can see this new event and fire a work flow to send agreed actions to asana or gmail for example?	Yes it can be
Why not use the Fireflies node for this in n8n? Samrudhi Mokai 02:02 PM Node and tool are different Please explain the difference, pls?	Tool is what is connected to the agent. We can connected Gmail tools and Calendar tools. Where-in the master agent is a node - the one which is not controlled by AI agent. Ask this question when you are in breakout room if this is not yet clear. Better to explain wit screen share.
Is API specific for single task? Or this is dependent on the app/website? If there is no API available for specific task, what do we need to do?	One API can support many tasks, such as reading, sending, and deleting email; available actions depend on the app. If a needed action has no API, look for a supported integration or use browser automation for that action in the app's interface.
How to deploy this Agent out of n8n?	Publish the workflow on n8n Cloud or a self-hosted server, then connect your app to its authenticated production Chat/Webhook URL. The exported JSON is a workflow definition for n8n, not a standalone application.
Will you be sharing the Json file?	yes, it will be available on your LMS under Resources section.
so how do we link this agent to which app..?	If you mean where to chat with the agent, start with n8n's Hosted Chat link or embed its chat widget in a website. Apps such as WhatsApp need their own supported connector or webhook into the workflow.
WHY WE ARE TEXTING RATHER THEN SPEAKING?	For voice interaction, add microphone input and speech-to-text before the agent, then text-to-speech if you want it to speak back. The same workflow can process the resulting text.
how this n8n can be connected with other chat tool or mascot?	Yes, it can be connected with other chat tools. one example is here Connect your AI Agent with Telegram - https://docs.google.com/document/d/1ttU1VXXy6Y61nPmVWwI04jkgfKUozC1CSbZLzgTOEWA/edit?tab=t.0#heading=h.nd1q589w4gem
Here the trigger is chat, could it be replace with voice and work through it N8N?	Yes, your voice interface can transcribe microphone audio and send the resulting text to the existing Chat Trigger, keeping the same agent workflow. Add text-to-speech if you also want spoken replies.
like a saltman?	
can we copy todays Json file for Jerry?	Yes, it will be available on your LMS Resources.
