

AIAP C14 Day 9	
Question	Answer
Now it is on	received :)
I am in	
on - test question	received :)
test	received :)
hi	received :)
hi	received :)
what is harness	In AI, a harness is the software infrastructure surrounding an AI model that provides its tools, memory, safety boundaries, and execution environment.
yes	received :)
It is on	received :)
hi	received :)
ready	received :)
Yes	received :)
yes	received :)
Can you please explain more about Libre_Chat tool as well.	LibreChat is a free, open-source chat app that looks and works a lot like ChatGPT, but you host it yourself and can plug in almost any AI model.
What is the difference between open WEIGHT and open SOURCE models?	Open weight: you get the trained model weights. You can download, run, and fine-tune it. But you don't get the training data, the training code, or the full recipe. Llama and most "open" releases are this. Open source: everything is public. Weights, training data, code, methodology. You can fully reproduce it from scratch.
is replit better than bas44 as a vibe coding platform?	depends on your goals they are fairly similar but for a mobile app replit would be best
now the chat is disabled	chat is enabled, just set to hosts and panelists :)
sound is great	
Since I loathe Elon Musk, Is there an alternative to Grokbot I may use?	claude routines are similar
The Chat is disabled	chat is enabled, just set to hosts and panelists :)
what is a "local" model?	an ai model that uses your personal computers hardware to run instead of a cloud server, you can use it even with internet turned off
msty is a local model right? The pre-read on tools asked to download it	Yes, that is a too for downloaing and using local models.
What does he mean with your own models?	You can use local models, as well as finetune the online models.
what is harness?	In AI, a harness is the software infrastructure surrounding an AI model that provides its tools, memory, safety boundaries, and execution environment.
not learned any local ai implementation	awesome, well we will be covering it today :)
Can we please get the slide decks so that we can pay attention vs trying to take screen shots of the decks he is covering.	
so i can use it in today's session instead of: Llama (Meta) gpt-oss (OpenAI) Qwen (Alibaba) Gemma (Google)	yes
Hi, may I have the co-mentor Angelo linkedin profile? Thx	Hi Chris. Sure. My LinkedIn: https://linkedin.com/in/angelo-emmanuel-john-574141282
thx	
Is Harness the same as Agent? If not, what is the difference?	the Agent is the "brain" and the Harness is the "body" or application that allows the brain to actually do work in the real world
if n8n expires after 14 days, then all the work projects too will get deleted, right? so we can import the json files to preserve these, right?	yes you can download them and use them on another instance of n8n e.g. self hosted
how to decide which memory to use, which Open AI agent to use, how much credit to load	Use Simple Memory for testing and Postgres/Redis for live bots; start with a "mini" OpenAI model and upgrade only if answers aren't good enough. Load \$5-\$10 to begin and set a usage limit in OpenAI billing.
I already have ollama LLM downloaded and running on my machine. Can I use that for connecting MCP servers?	Yes. Connect Ollama to an MCP-capable client like Claude, ChatGPT, n8n (Ollama Chat Model + MCP Client Tool in the AI Agent)
can you give a more explicit concept	for which topic?
Is harness the LLM then?	no, the harness is the application around the llms eg claude desktop
This means, Claude, Codex, Grok are all harnesses	Yes, that is correct.
Is it a desktop app ?	yes
but what is a model?	model is the actual LLM / ai model doing the processing
In LMS, I don't see recordings for Saturday and Sunday afternoon sessions. I only see recordings for morning sessions. Can you please check?	On the recording page for the day, you will need to scroll down for the recording of the afternoon session.
HARNESS = MCP + CONNECTORS?	no, mcp and connectors are the same but the harness is the actual application itself that has models and mcp in it
what is difference between harness and connectors	connectors are the external tools that can be connected e.g. whatsapp, slack, crm etc but the harness is the actual application itself that has models in it
One question on Vibe coding - can I build the exact same CRM tool that we built in Bolt on 6 in Lovable? I had to sign up for Lovable so I would prefer to use those credits.	Yes, the vibe coding platform does not matter. But the prompts would need to change. If you remember the steps, we gave AI the best practices for bolt. Lovable also has published prompting best practices. Use them to customise your prompts for lovable.
Difference between Chatgpt vs Codex	ChatGPT is the open ai chatbot for general questions, codex is open ai's AI coding tool
Harness = MCP?	No. The harness runs the AI; MCP plugs tools into it.
what is Claude's skill equivalence?	Skills is also an open standard, so some other agent tools support it too. Closest equivalents are Custom GPTs in ChatGPT, Gems in Gemini, and Projects with custom instructions in Grok.
how to choose between chatgpt and claude?	The quality is very close with claude performing slightly better in certain tasks (e.g coding in my opinion). It comes down to cost (Claude is generally more expensive especially for api requests) and features (some features are unique to either platform)
Can I feed data from an excel in Google Drive, connect to chatGPT and connect that to Tableau connector and produce a dashboard?	yes
can i use Ollama LLM to connect to Claude desktop?	No. Claude Desktop only runs Claude models. To use Ollama with a similar chat-plus-MCP experience, use LibreChat or n8n instead.
IS LLM also part of harness	No. The LLM is the brain; the harness is everything around it (tools, memory, loop) that lets it act.
Coding Agent too has access to tools & skills, how is that different from HArness	A coding agent is a harness, just one built for coding. For example, Claude Code is the harness, and the LLM inside it is Claude.
Will there be a break-out session today?	Yes, but no workbook. Only Q&A on the breakout rooms.
so for the chat gpt codex we need to download the app to desktop or can i use the browser and how did the instructor come to this section? or the screen	Yes, It's the Codex Desktop app.

this codex is integrated in paid version of ChatGPT or its another platform on OpenAI website?	It's part of your ChatGPT account, not a separate platform. Codex is included across ChatGPT plans, including Free and Go, with usage limits that vary by plan.
I have ChatGPT Pro but not seeing the skill Context7 as an option	context7 is a plugin , are you using the chatgpt desktop app?
When will hosting local LLM be covered?	
What does up-to-date documentation mean in this context?	api documentation on how to external software works and how to connect to it, basically developer documentation
what is white coding	vibe coding - its the process of building web applications using AI
He has Codex in his claude?	In chatgpt
up to date documentation of what ?	Context7 is an MCP server that pulls up-to-date, version-specific documentation and code examples for libraries and frameworks, and feeds them straight into your coding agent's context. The problem it solves: models are trained on old docs and hallucinate APIs that don't exist anymore. Context7 injects the current, real documentation at query time, so the code the agent writes actually works.
How is context7 different from github?	Context7 is an MCP server that pulls up-to-date, version-specific documentation and code examples for libraries and frameworks, and feeds them straight into your coding agent's context. The problem it solves: models are trained on old docs and hallucinate APIs that don't exist anymore. Context7 injects the current, real documentation at query time, so the code the agent writes actually works.
can you explain what is Codex?	Codex is OpenAI's coding agent. You give it a task in natural language, and it writes, edits, and runs code autonomously in its own environment, then hands you back the result.
so u add only docs to this context7 tool what does this tool do	Context7 is an MCP server that pulls up-to-date, version-specific documentation and code examples for libraries and frameworks, and feeds them straight into your coding agent's context. The problem it solves: models are trained on old docs and hallucinate APIs that don't exist anymore. Context7 injects the current, real documentation at query time, so the code the agent writes actually works.
Wouldn't it just look at github or wherever the repo is hosted to check the latest? Provided we prompt it to do this?	Yes, but only if it has access, like web search or a GitHub connector/MCP. Without that, it can only guess from its training data, which may be outdated. However, if you provide a prompt to do, it works too.
can u show the same on Claude please?	
what's context ? ?	a connector that gets up to date developer documentation for any tool you try build a connection/api for
does context 7 grab updates continually? even after the product has been built?	yes
Is Claude running Codex or Codex running Claude?	Thye are running independently.
Coding Agent too has /access to tools & skills, how is that different from HArness	Same thing. A coding agent is simply a harness designed for coding, which is why it comes with tools and skills.
thanks	
How to find appropriate connectors and skills?	You need to ask AI. Describe what you want to do, and ask it what skills and connectors or plugins you need.
Plz repeat dint get	
ignore - Plugin (not skill) found it	cool :)
is he setting up the context 7 in codex or in chat gpt?	Right now, he is in chatgpt. You can seet in te top right.
Did you connect to GitHub or gmail?	either one works the same
can you please repeat the last part?	
is harness just a way of connecting the knowledge base with llm?	No, that's RAG. A harness does much more: it gives the LLM tools, memory, and a loop so it can take actions, not just look things up.
sorry, i missed the earlier part...what is harness means here?	A harness is the setup around an LLM (tools, memory, instructions) that lets it actually do tasks. Think of the LLM as the brain and the harness as its body.
Will the free models have Harness? in them	No, the software or system which uses the AI models are the harness.
Can we build these harness using local LLMs	Yes. Run the model with Ollama and connect it to n8n's AI Agent or LibreChat; that setup becomes your harness. Just pick a model that supports tool calling.
Can you build the harness around OpenRouter?	You absolutely can. You can also connect openrouter o other harnesses.
Harness = Plugin/Connector+Skill ?Right ?	yes
Can it be done on Perplexity or LibreChat?	Do you mean adding Harness part?
	Please post your full query, it helps us understand and answer correctly. thanks.
Will harness change based on the problem we are solving or is there a common set of harness that we should use and build on it as necessary?	its personal preference, for example if you want to use claude code for coding then you are using claudes harness - its task dependant
can u give an example how to use in chatgpt after connecting the context7	when building an app and you want to connect to an api for example fireflies, it will go read fireflies api documentation to understand how to use the api
Chat to Host/Panelist is disabled	
So, if we use Context7, the old data that the model is trained on is ignored and only the new data is used?	yes
for Context7 did we logging to GitHub or gmail for authentication?	either one works
is n8n equivalent of harness ?	no, n8n is more of a workflow automation tool, claude code is an example
What is Codex?	Codex is OpenAI's coding agent. You give it a task in natural language, and it writes, edits, and runs code autonomously in its own environment, then hands you back the result.
define documentation here ?	developer api documentation on how to connect to a specific api
why only context 7, is there any other documentation option?	Context7 is just the popular one. Alternatives include GtMCP, DeepWiki, Ref
3itesh, am a bit unclear... if LLM is the brain and Harness is the body, what roles does an agent play in this context?	The agent is the whole thing working together: brain (LLM) + body (harness) doing a task. So LLM + harness = agent.
Is codex similar to claude code?	yes
why do we need to give search tool. Chat gpt has limitations in searching... what does this mean	
If it runs in its own environment then we are not using ChatGPT or Claude's tokens, right? Does Context7 has token usage and price plans?	Right. With a local LLM you pay no ChatGPT/Claude tokens, though Context7's docs still use up your model's context. Context7 has a free plan for public repositories
Where does the model end and the harness begin – and does that distinction actually matter?	harness is wrapped around the ai model
today's session was meant to be on Grokbot but not having a build and keeping it theoretical is difficult to later try to use Grokbot.. Or is this session the Friday session continuation mixed with todays topic ?	we are covering a few things in the session including grokbot
I M NT ABLE TO UNDERSTND THE CONTEXT OF TODAY'S SESSION. WHAT R WE TRYING TO DO ? WHAT'S THE GOAL	So far, we're learning Harness - these are things that ensure your agent performs well. Harness includes Skills & Connectors.
how do i change search defaults for claude and chatgpt to parallelssearch from websearch i	You can't swap the built-in default, but you can add Parallel Search as an MCP connector and turn off the built-in web search. In Claude, add it under Connectors; in ChatGPT, add it via Developer Mode connectors, then prompt it to use Parallel.
its available as MCP ?	please clarify

even Perplexicity is for Search right ?	yes
pls share this link from vinod	
What does parallel search MCP do again?	It's a web search tool built for AI. It returns clean, ready-to-use results that the LLM can read directly, instead of regular search pages. Google Search -> Search Engine for Humans Parallel Search -> Search Engine for AI Agents
then why we are using that here ?	
Perplexicity has comet, is comet not good enough?	Yes, It's decent. Opinions may be divided.
Pls can you share link	
can i install all of them ?	please clarify
Do we need a high model do be able to install MCPs?	No. Installing an MCP has nothing to do with the model. It's just connecting a server to your client (Claude Desktop, Cursor, etc.) through a config file. Any tier can do it. Where the model matters is using MCPs well. A stronger model orchestrates multiple tools better, decides when to call them, and chains them against a task. But the install itself is free of that.
Can you please show again?	
Can we quickly review the parallel search steps, where to set it, what to search for , URL please	1. In ChatGPT, open Settings -> Connectors -> Advanced Settings and turn on Developer Mode. Then, in connector settings, click Create. Parallel 2. Name: Parallel Search MCP. URL: https://search.parallel.ai/mcp. No API key or OAuth is needed; the server is free to use. Parallel 3. In a new chat, enable the connector and ask it to "use Parallel Search."
i see a parallel search in codex plugins? how is it different?	Same Parallel Search underneath. The plugin is just a one-click install for Codex, often bundled with extra instructions (skills), so you don't have to add the MCP URL manually.
Q: Can parallel search work on cloud (Dileep mentioned it works only on desktop app)?	
why we need parallel is a search engine or a model?	It's a Search Engine built for AI Agents.
link for parallel search installation?	https://parallel.ai/
Parallel Search is available in Plugins on chatgpt, why did we have to go to the perplexity to search for MCP? Is there a difference?	you can use either
As its a desktop app, the data on the pc is private when we use chatgpt	
how is Parallel better than Google or other search engines?	It gives responses that are better optimized so LLMs understand faster.
is firecrawl free?	Yes, there's a free plan: Firecrawl gives 1,000 pages free every month, no card needed. After that, paid plans start at around \$16/month.
why to build a harness. chatgpt app is enough for us to get things done. it can connect to all MCPs directly, why the need for harness? is chatgpt app not enough? is it that we are adding all these so that we can ask chatgpt to make our local agent?	chatgpt is the harness around open ai models
What does firecrawl do?	It reads websites for your AI. Give it a URL and it returns clean text the LLM can use, and it can crawl whole sites too.
does ChatGPT know this is for a specific project? Can we understand what Dilip is trying to build to need a scraper or would we need a scraper as a best practice for all projects?	
when/why do you need to know if the model i use is "smart" enough? When is a practical reason to be thinking about my "harness"?	
Dileep is using the word "Codex" - what is it?	Codex is OpenAI's coding agent. You give it a task in natural language, and it writes, edits, and runs code autonomously in its own environment, then hands you back the result.
is chatgpt desktop version work only on gpt plus its not working with go plan	It should work on the go plan
instead of firewal can we use apify for scraping?	yes
can you explain why doing it this way vs searching for firecrawl to just click. i must have missed that part.	just preference :)
unrelated - what malware checker is good for Safari :-)	Malwarebytes for mac
can you repeat	
should we do these installations in parallel? I'm trying but it's slow	No, do not do side by side with dileep
best scraper tool for scraping instagram accounts of competitors like everything content, script, comments and for self also where we can get data of posts, dms, comment analysed. I dont think apify can do that, also what can i use for pintrest scraper	Apify has some really good scrapers (or actors) for this.
Why we need to install Parallel Search or Firecrawl, i think chatgpt already has chat features ?	These targeted services can provide much better results.
what exactly can you achieve by scrapping a website?	You can know what content the website has.
please share the prompt we can side by side install on desktop chatgpt	this is not a build along session :)
We need to pump money in Harness (unless they are free) on top of Codex and Claude Code :)	correct, some harness components may be paid, but performs really well with harness.
So are we recommended to always use the desktop apps vs browser?	Yes, it has more powers with the Desktop app.
is crawling legal?	Generally yes for public pages, but respect the site's terms and robots.txt. Avoid scraping personal data or content behind logins without permission.
is mobile apps are avaiable for GPTs. Like Chatgpt desktop app	Yes, they have mobile apps.
to use a desktop chatgpt, what is the system config required.?	Mac needs macOS 14 with either Apple Silicon (M1 or better) or an Intel processor. On Windows, any updated Windows 10 or 11 PC works; no special hardware is needed.
Can you explain the why of these elements of a Harness. Function of search, scraper etc for every Harness other than Code which is extremely important	
What is the difference b/w Desktop app and Open Source Model? Example: Claude desktop vs Ollama	Claude Desktop is an app that sends your chats to Claude in the cloud. Ollama runs a free, open model directly on your own computer, so it's private but usually less powerful.
Why are we doing this? Do not udnerstand the purpose!	Helen, we are teaching how to create bots inside of Grokbot. They are super powerful, and can do real work
Is there no workbook for today's session? I am not able to view it on LMS	No workbook for today. We will have a breakout room to answer Q&As
Is it legal to scrape and social media app?	Generally yes for public pages, but respect the site's terms and robots.txt. Avoid scraping personal data or content behind logins without permission.
What is YT/IG scraping?	Youtube, Instagram scraping - pulling data from those platforms
scrapping is leagial, can any website be scrapped like Apollo.io, hunting.io, etc	Generally yes for public pages, but respect the site's terms and robots.txt. Avoid scraping personal data or content behind logins without permission.
what is YT / IG scrapping.?	Scraping from YouTube or Instagram, to prepare for your content.
using Apify can i scrap the comments on particular post or video on youtube shorts or youtube video or ig reels or stories?	yes
Didn't want to miss understanding this - how is Parallel better than Google or other search engines?	parallel is like a browser built for ai agents not humans
CAN YOU SHARE THESE LINKS HERE	
ytdlp was used for?	youtube scraping

what is yt-dlp? missed explanation - sorry	yt-dlp is a free, open-source command-line tool for downloading video and audio from YouTube and thousands of other sites.
the process is same for claude?	yes...
yt-dlp is better scraper is as good as apify?	yt-dlp: specialized for extracting video and audio from media sites. Free, runs locally. Apify: a general web scraping and automation platform. Scrapes any site, structured data, runs in the cloud, handles scale, proxies, scheduling. Paid.
Can you share the link?	what link are you looking for?
The mentor is using free or premium gpt?	premium
I dont have a paid version of ChatGPT, will i still be able to do what Dileep is showing?	Mostly, yes. Codex works on the free plan with lower usage limits, but custom MCP connectors (like Parallel) may need a paid plan; if so, you can use them free in LibreChat or n8n instead.
how do you find all these tools. Its impressive	You Learn them as you but you can subscribe to ai newsletters to keep up with the latest developments or use a ai tool web repository
are we supposed to be installing as these as you go along	No, Please watch for now. We recommend you to try later.
What is the purpose to do all these things?	To get better results/output from Claude/ChatGPT
YT DLP is only for Youtube?	Yes, YT DLP is for Youtube only.
Is there something similar for IG / FB as well? How do we connect our FB & IG account with Claude / ChatGPT?	For IG/FB, you can use Apify Actors for this.
what is yt-dlp	It's a specialised scraper for YouTube.
Can we install multiple scrapers? How does the harness decide which scraper to use? Do we have to define that?	Yes, if you have multiple tools which do the same thing, you would have to tell AI which scraper to use for which specific purpose.
chat to Host is disabled	Hi - Chat is set to hosts & panelists :)
answer my question	
what is yt-dlp good for?	yt-dlp: specialized for extracting video and audio from media sites. Free, runs locally. Apify: a general web scraping and automation platform. Scrapes any site, structured data, runs in the cloud, handles scale, proxies, scheduling. Paid.
Hi	
Angelo - i am getting error You've hit your usage limit. Upgrade your plan or add credits to continue, or try again at Oct 18, 2026, 8:42 PM.	
Are we supposed to set up chatgpt while Dileep is doing this?	no
Why not just use the plugins options? Why put in de code?	either way works :)
When will hosting local LLM be covered?	
is Codex another version for local ChatGPT or was it a mistake whilst speaking by Dileep?	Codex is the coding software created by ChatGPT.
What we want to achieve?	
I had trouble completing the workbook for yesterday. I attempted it on om own today and got caught in Step 11	What was the exact issue? Possible to send the details onthis Q&A?
firecrawl, please once again	yt-dlp: specialized for extracting video and audio from media sites. Free, runs locally Apify: a general web scraping and automation platform. Scrapes any site, structured data, runs in the cloud, handles scale, proxies, scheduling. Paid.
Does creating this harness use up a lot more tokens?	Yes, somewhat. Each tool and skill adds instructions the AI reads, and every tool call uses tokens, so only add what you really need.
is there a scrapper which can find suitable books for a specific topic by doing heavy lifting... if it is available online and if not, at least give the name of the book	No single scraper does this, but an agent with web search plus the Open Library or Google Books API can. It finds books on the topic and shows which are free to read online, otherwise just the title and author.
What exactly is Yd-p and how does it make apify free to use?	yt-dlp: specialized for extracting video and audio from media sites. Free, runs locally Apify: a general web scraping and automation platform. Scrapes any site, structured data, runs in the cloud, handles scale, proxies, scheduling. Paid.
Can we say something like ASTRA can do all this by itself, just that you setup harness to save credits or do it faster?	yes correct
I have shared the error under Doubts in LMs	
What are the best practice to make sure these search plugging are free from bugs , any extra step just to make sure it is robust?	
so use yt-dlp through gpt-hub?	just ask Codex/Claude Code to install it for you Give them the link to yt-dlp's Github - https://github.com/yt-dlp/yt-dlp
How does he get his to have full access on his laptop? In the chat bar	you click on it where it says "as for approval" and change it to full access
Does Firecrawl work, if the website require login credentials	Not by default. It works for public pages; for login pages you'd need to pass session cookies/headers or use browser actions. Only do this on sites you're authorized to access.
Does firecrawl charge? will chatgpt tell us how much it is charging us?	They have a good free tier, after which it is a specific subscription.
Please advise and suggest	
why are we doing all this, is chat gpt not enough. Will all this harnesses make chat gpt better performer? if yes, why	ChatGPT is enough for chatting. A harness makes it better at doing things: it gets real tools, fresh data, and your own files, so it can complete tasks instead of just giving answers.
please suggest ways/means to scrape linkedin, as apify/composio/firecrawl do not seem to work	linkedin has an api - id suggest looking into that
can chatgpt not simply read the website insted of scraping it?	yes it can - but scraping tools specialise in getting large amounts of data and cleaning it to save tokens and improve speed
Hoping for resolution and next steps	
i missed last 10 mins can someone sum up ?	We're currently learning Grokbot, earlier we covered more on Harness. You can use Zoom's AI Companion on top of Zoom app and ask it to Summarize.
to save credits can we use both togetehr in a workflow?	sure, model switching is a best practice
hw is context? helping in this example	It gives the AI the latest documentation for the tool it's using (like yt-dlp), so it writes correct, up-to-date commands instead of guessing from old training data.
along with books reserach documents and patents and white papers alsio which might be generally not easily accessible	
where do you see all these settings on codex?	hes using chatgpt desktop app
Since my Q was taking time, asked ChatGPT on why Parallel - here is what it said :-) Google → "Help me find something." Parallel → "Give my AI agent the web information it needs to accomplish something." ChatGPT → "Understand my objective, research it, reason over the information, and give me the result."	
What is the equivalent of FULL ACCESS in Claude?	"bypass permissions" but you need to enable it in settings first then under the chat set it to bypass
What does context?does? Please tell briefly	Context? is an MCP server that pulls up-to-date, version-specific documentation and code examples for libraries and frameworks, and feeds them straight into your coding agent's context. The problem it solves: models are trained on old docs and hallucinate APIs that don't exist anymore. Context? injects the current, real documentation at query time, so the code the agent writes actually works.
If AI did not have YT-DLP installed, wouldnt it anyway look for a similar kind of MCP to complete the task when requiring to scrape a video?	yes then it will most likely ask you to make an account if required

Can i set harness with free chatgpt ?	Yes, partly. Codex works on free with lower limits, but custom MCP connectors may need a paid plan
will an agent for scraping youtube for instance do instead of harnessing?	
does this required paid or free chatGPT?	it can be done on free - hes using codex on the chatgpt desktop app
can we set up harness of ytdlp in free version of chatgpt?	yes using codex in chatgpt desktop app
cant chatgpt automatically pick the cheapest tool? like yt-dlp / firecrawl always	sometimes yes, but sometimes its wrong - best method is to ask it to tabulate alternatives
this is scraping one video. How did Vaibhav scrape the whole account of an influencer?	there are endpoints for scraping accounts, ai can assist you finding the endpoint
How often do we need to update the?	Could you send your full question please?
Can you please let me know whether this harness setup can extract the information from a set of specified website domain instead of a single page?	
what happens when we need to get around a robots.txt obatade when trying to scrape for data? Is there a product that can get around that?	Don't get around it. robots.txt is the site owner saying "please don't," so ignoring it can break terms and get you blocked.
I checked the current Parallel documentation, and I want to correct one important thing from earlier: Parallel's current documentation confirms that ChatGPT can use Parallel Search MCP, but it requires Developer Mode and the MCP feature may not be available on every ChatGPT account	right. It depends on the plan too.
where should we give full access to Chatgpt app?	
WLL WE GET THESE LINKS IN WORKBOOK	there is no workbook today :)
So why instal it? If you use plugins it is instaling also?	A plugin is just the one-click way to install the same tool, so you don't need both. Use the plugin if one exists; otherwise add it manually.
do we need do always mention harness name in prompt	no, you can ask it to suggest alternatives
how to decide where to go to copy to add, github or directly to website etc	Always go to the official source first, i.e. the tool's own website or docs, for the connector URL or setup steps. Use GitHub only if it's the tool's official repo (check that it's owned by the company and has many stars).
no ai slop is skill is already available or custome created	custom
Why did you go gih hub to copy the URL for yt-dlp?	To tell ChatGPT to install the connector for us.
will it work also in claude Desktop and GPT desktop. It requires subscription after a few use	Yes, it works in both Claude Desktop and ChatGPT Desktop via connectors. Free plans hit limits quickly, so regular use will need a subscription
How much it will accurate while get a scraping from website or youtube?	Websites: very accurate for normal public pages, but it can miss content on sites that block bots or need a login. YouTube: it pulls the transcript, so accuracy depends on caption quality (manual captions are better than auto-generated).
Where do i see the list of these tools which we have installed through prompts? Is there a single place I see all these harnesses?	We installed these - - Parallel Search - yt-dlp -Firecrawl/Apify - Context?
Plugin would be for inbuilt tools, Right?	
Team today's session was meant to be on Grokbot correct ? If it is and if we are not having a build (exercice) and it is being kept theoretical only makes it difficult to later try to use Grokbot.. Or is this session the Friday session continuation mixed with today's topic ? I am a bit confused.	this is a grokbot session but you dont need to build along :)
Jitesh, If my org has only Zapier approved and not n8n, is it possible to build all the workflows we tried so far in n8n through Zapier? Also, any advice on getting started and becoming an expert with Zapier	Yes Vivek, it is very much possible to build those workflows on Zapier too. Concepts remain the same - Trigger, Logic, Actions. Btw - Zapier is the most user-friendly to get started. You can try Zapier Academy - https://learn.zapier.com/
would it not work without harness?	It can work without harness, but gets you better outputs if you use harness.
can someone explain the github and setting up harness part ?	we just took the github link for yt-dlp and asked our AI to install it.
Do online version of GPT / Claude already have access to these harnesses?	Yes, claude's online version currently has broader mcp access than chatgpt. claude supports custom remote mcp connectors even on the free tier. (then limited amount)
https://github.com/yt-dlp/yt-dlp in claude only works in the chat it got installed. Can it be saved in a different way that it becomes permanent?	If you're using on the desktop app, it would work permanently.
firecrawl and yt-dlp are doing same thing? scraping content?	yt-dlp is for media, firecrawl is for pages.
got it	
and how to keep up to date what is the latest tools	create an ai agent to email you a daily brief
why we cannot install these 3 directly by searching in plugins section ?	You can if the plugins exist
What would you use for search if online?	please clarify
yt-dlp itself can't reach youtube.com — this workspace's network policy blocks that host outright (403 from the egress proxy), and that's not something to route around. I identified the video via search instead.	You would need to install it on the computer itself. And not inside the claude harness.
This is the error it is showing in my claude for YT DLP? and I am not able to install it in Chat GPT	
Do some websites block web scrapers?	Yes, many websites do using captchas, rate limits or Ip blocking
so when we build a prmpt, do we always have to specify the tool, or will it choose the appropriate option out of teh installed tools?	
As its a desktop app, the data on the pc is private when we use chatgpt	yes
When we ask chatgpt to download these tools, does it only keep it as mcp connector or do they go and sit in our programs line any other application??	depends on installation method but generally as external applicatioston
firecrawl once again can you show	
what does yt-dlp have to do with apify? also i didnt understand how to get yt-dlp from github? can you share again?	https://github.com/yt-dlp/yt-dlp It's a specialised audio/video downloader that works great with YouTube.
When you setup the harness on ChatGTP or Claude one on PC, will this be available on other PCs?	Connectors added in your account settings follow you to any PC once you log in.
What is advantage harness provide against Websearch option?	They aren't competitors. Web search is one tool; a harness is the setup that lets the AI use web search plus other tools, memory, and actions together.
whats the gpt model required at the time of installing,	
why are you now answering my questions- I have posted 3 of them- all are unanswered?	
for vibecoding outside of normal Claude Code?	
for Facebook would I use fb-dlp?	You could use Apify actors to scrape from Fb.
which tools works best for scraping linkedin	apify
so this actually mean that we do not have to have both ChatGPT and Claude for different purposes ????	No You can choose either
me	
can these scrallers scrap websites which in normal browser operation need login and can block the website if any ai tools integration is detected	Sometimes, using your own logged-in session, but it's risky; the site can detect it and block or ban your account. Only do this on sites whose terms allow it.
how do you know what harness tools to choose?	Start from what you want to do: then decide what harness is required for what you need to achieve.
its not difficult	
its very difficult to set up harness enable the chat'	

So its like:	
All this setup is required only for codex? or is this setup relevant even for regular chatgpt chats?	Connectors (like Parallel Search) work in regular ChatGPT chats too. Folder-based files like skills and project settings are mainly for Codex.
The problem is that your ChatGPT account is on the Free plan, and OpenAI currently says custom MCP/developer-mode availability is restricted by plan/workspace. In particular, OpenAI's current documentation says full MCP is available to Business and Enterprise/Edu, while Pro users can use read/fetch MCP connections in developer mode.	Yes that's correct
Scrapping a website & giving a feedback- would it not work without harness?	Using web search capabilities, it can, but dedicated web scraping tools are even more powerful and can deal with high data volumes.
Not difficult...just hard to wrap my head around when I should challenge whether the model is smart enough or not.	you can do a process of elimination, if it cant do the task then just use a higher model
if you once install the harness is it permanent or do i have to do it everytime?	It's a one-time setup.
can you explain so many tools what to use when is the LLM decision or we have to use it manually?	
ISNT IT INBUILT? WHY DO WE DO IT SEPARATELY	
Do we download the ChatGPT file for local set up and harness in the same folder? Not sure if we have any control how the harness we downloaded via Vibe coding get stored	No need for the same folder. Install ChatGPT normally, and the harness files get saved in whichever project folder you open in Codex
when should we use harness, i mean in which scenarios . up until now we were able to build without it. so a bit confused when exactly to put it to use	When you're building a more complex, long running system that needs coordinated tools, memory/state, permissions, retries, approvals or multiple steps/sub-agents
you don't need to install an MCP if there is already a connector, correct?	correct
Just by pasting an url of a tool, we can install that harness	yes.
So installing harness for chatgpt gemini clause different ?	Yes, each of them would be independent.
thanks for showing your n8n marketing flow during the office hours in the end. Is that something you could share?	
what does apify, hidecrawl and other apps do ?	They provide web-scraping infrastructure to help collect data from websites they handle the browsers, proxies scaling and antbot measures so you dont have to
How much it will accurate while get a scraping from website or youtube?	Websites: very accurate for normal public pages, but it can miss content on sites that block bots or need a login. YouTube: it mainly pulls the transcript, so accuracy depends on caption quality.
So can we install different Harness configurations, name them, and use them for specific projects or clients?	Yes you can create reusable named harness configurations with different tools, permissions, prompts, memory and agents then apply them to specific projects
So its like download chatGPT local -> and context? - scrape - then yt-dlp ?	yt dlp was the tool for scraping
When will hosting local LLM be covered?	we will learn shortly.
Maybe easy, but there are alot of settings. I discovered that need updating to apply basic security with Grok-bot	True, and it's worth doing.
That means we need not install anything in our model.	
Can we install multiple scrapers? How does the harness decide which scraper to use? Do we have to define that?	Yes, you can install multiple scrapers. And the answer to "who decides" depends on how you set it up. Two models: 1. You define it (deterministic). You write the rule: YouTube URL → yt-dlp, general site → Apify. The harness follows your logic. Predictable, reliable, but rigid. Best for production workflows you run repeatedly. 2. The agent decides (autonomous). You give the model access to all the scrapers as tools, describe what each does, and it picks based on the task. This is where model smartness matters. A strong model routes correctly. A weak one calls the wrong tool.
their defaults are crazy	
that is great i wanted to use them for the comment anaiyas	
is harness and grok bot same?	no
why chat to Host is getting disabled	
when we work with Grokbot	
Is scraping like higher level search? Why can't I just tell Chat or Claude to watch the video and give me a summary? Why do I need to tell it to scrape the video?	you can but it will be slower than using a specialised scraping tool
Is this harness setup a one-time thing, or do we have some use cases for dynamically setup these "invisible" harnesses with Grokbot?	Mostly one-time; set it up once and reuse it.
so you means to say just trying to fine tune	Yes it is to fine tune
The harness was completed with the tools you added or there are more tools and skills to be added?	You can keep adding more. What we showed is a starter set; add tools and skills as your tasks need them, just not too many at once, or the AI gets confused.
Can somebody put together all the websites and the tools mentioned so far today for building up the harness?	Search - - Parallel Search - Tavily Search - Perplexity Search Web Crawling - - Firecrawl - Apify -Yt-dlp
Correct?	
That means we need not install anything in our model while working with Grokbot	Yes that's correct
do we need to specify after adding harness- the specific harness name/	
I'm just copy/ paste parapapp url and it won't connect. I posted the chap gpt responses already in	
ok	
parallel	
jitesh is there any bot , site to check caption quality/accuracy that you know of ?	No dedicated tool I'd recommend. The quick check: on YouTube, open captions settings; "auto-generated" means lower accuracy, while manual captions are usually reliable.
what is difference between harness and grok bot ?	the harness is the software layer around the ai model that gives it tools, memory, context permissions ability to take actions an grokbot is a specific ai agent built using a model and a harness and configured for a specific purpose
Grok Bot / instince and Muse is open source ?	No
what was fine tune again ?	Fine-tuning is taking a pre-trained model and training it further on your own specific data, so it specializes in your task, style, or domain.
why PILOT is cockeipit?	
What is the harness for Search , sorry missed that	Parallel Search is what we used. You could also use Tavily Search or Perplexity Search.
All this setup is required only for codex? or is this setup relevant even for regular chatgpt chats?	It can be used for regular ChatGPT chats too.
is there a scraping tool for udemy , linkedin learning	Not something which would work directly. yt-dlp can do it, but finding the scraping URL correctly can be very tedious, and not always possible.

So, scraping is faster than just regular searching? Is scraping more accurate or does it return the same results?	Not faster, just different. Search finds which pages are relevant; scraping reads one page fully, so it's more detailed and accurate for that page.
Can Codex or Claude Models be used as LLM's inside the Grok Bot?	No. Grok bot runs on xAI's own Grok models. It's a closed product. You can't swap in Claude or GPT/Codex as the engine inside it. The reason: Grok bot is a finished consumer product, tied to xAI's models and infrastructure. The model isn't a setting you change.
CHAT IS DISABLED	
WHY	
we have not use any harness till today	
If AI Agent now is Model + Harness, is Memory part of Harness or is that still separate?	Memory is part of the harness. It's one of the harness's core jobs. The harness manages everything around the model: the loop, tool orchestration, context, and memory. Memory is just the harness deciding what to store, what to retrieve, and what to feed back into context on the next turn.
its like manager and reportee— Maanger decides, reportee executes	yes
Samruddhi/Angelo, appears you are overwhelmed with Qs... repeating my question again, if you can answer:	
Is this harness setup a one-time install task, or do we have some use cases for dynamically setup these "invisible" harnesses, that needs tools like Grokbot?	The harness can be persistent but dynamic harnesses are useful when agents need to create task-specific tools, permissions, context or sub-agents on demand.
Why did you go git hub to copy the URL for yt-dlp? Is the installation code and MCPs stored in github? Can we do this for all installations?	yes you can
harness = mcp?	No, MCP is a protocol for connecting ai models to tools or data, while a harness is the broader system that manages the model, tools, context permissions and execution
what is hermes	its a personal ai agent like open claw that runs around the clock
where is the memory of AI Agent in Model+Harness	in the harness
is harness equivalent to plugin/connector?	no its the application that holds everything eg claude code
Is Harness a tool or is there more to it than just the tool?	its the actual application infrastructure that holds everything
IS RAG part of harness	yes
CahtGPT, Claude, etc. must have built in harnesses that we are augmenting, correct?	yes
If I give Chat a video or page and tell it to read/watch it, how would the results be different than if I give it the same video but tell it to scrape it?	Different mechanisms, different quality of result. "Read/watch it" (in-chat): the model uses whatever native ability it has. For a page, it fetches and reads the text. For a video, most chat models can't actually watch it. They read the transcript or metadata if available, or they guess. Fast, but shallow and often incomplete. You're limited to what the model can natively access. "Scrape it": you're invoking a tool (yt-dlp, a scraper, an MCP) that deliberately extracts the raw content. Full transcript, clean text, structured data, timestamps. Then that gets fed to the model. Slower to set up, but you control exactly what goes in, and the model works from complete, accurate source material. The core difference: read/watch = the model's best guess from partial access. Scrape = deliberate full extraction, then the model reasons over clean data. Garbage in, garbage out. Scraping fixes the "in."
grok has claimed it can make apps too, a good idea to work with it?	its personal preference, i prefer claude code but its up to you
When we vibe code from Lovable thru chatgpt - is it expensive as taken from both will be used or please advise please can we have the tool list (including those mentioned in the chat) after the session	i believe its more expensive will be shared in the lms
how to install https://github.com/yt-dlp/yt-dlp in Claude? i pasted in the chat but it only works for that chat. Help plz	You will need to tell Claude to install it globally. Then in new chats, you can just ask Claude to use it. And it should work.
we need not install anything in our model while working with Grokbot	no
Why are Harness not inbuilt , or why dont AI tools suggest the plug ins to get better outcomes ?	Kunal, if you can describe what you want to do, AI should be able to recommend what to use.
if someone is using cursor , how to get Grokbot in claude as Harness?	Grokbot is owned by XAI which also owns Cursor. This is why it is available in Cursor
What is cursor?	Cursor is an AI code editor. It's a fork of VS Code with AI agents built into it, so you can write, edit, and refactor code by talking to the model instead of typing everything yourself. What makes it matter: it sees your whole codebase as context. You can point it at a task, and it edits across multiple files, runs commands, and fixes errors. You choose the model underneath (Claude, GPT, Gemini, etc.), which is the swappable-model point from earlier.
which one is better cursor or grok bot plan for developing the apps	Cursor: purpose-built for developing apps. It's a code editor with AI agents. Sees your codebase, edits across files, runs code, ships real software. This is the tool for the job. Grok: a chatbot. It can write code snippets in a conversation, but it doesn't live in your project, can't edit your files, can't run your build. You'd be copy-pasting code out of a chat window. Fine for a quick function, useless for building an actual app.
y grokboat is required	It isn't required; it's one option. It's useful if you want a ready-made agent that runs tasks on its own and uses live X data, but ChatGPT, Claude, can do similar work (but you have to add harness separately)
What is the go to strategy in terms of plan? Grok bot only or cursor path	If you do a lot of AI-backed software development, Cursor is excellent. You should then get the Cursor plan. If you don't do development, you can get only Grokbot.
Is there a scrapping harness to LinkedIn Or Job portals such as Seek etc ?	Yes. Apify has ready-made scrapers for LinkedIn Jobs, Seek, and Indeed, and you can plug them into Claude or n8n via its MCP. Note that LinkedIn restricts scraping, so stick to public job listings.
Dileep has shown how to scrape one video. How did Vaidhav scrape the whole account of an influencer?	Same tool, just pointed at the whole channel URL instead of one video. Tools like yt-dlp (or Apify) then loop through every video and pull all the transcripts in one go.
How is GrokBot different from Claude Cowork?	Dileep showed only one in the interest of time.. You can still have it run for multiple or entire channel.
DIFFERENCE BETWEEN AI EMPLOYEE AND AIAGENT PLS EXPLAIN	it has a simpler user interface , but all the same things can be done in claude in a more complex way
I am using cursor and plan grok 4.6 medium. So can I get Grok Bot ?	In many cases it's the same. But an ai agent is generally designed to perform tasks autonomously and and ai employee is created to perform a role or business function autonomously
Do we get access to Grok Bot from outskill as well?	Not through Cursor. Using Grok in Cursor gives you the model for coding only; Grok bot is set up separately with your xAI/Grok account.
what is the difference between a bot and an agent?	A bot usually follows predefined rules or a fixed workflow, agents can reason, choose actions or tools and adapt it's approach to achieve a goal
Can we create a MCP in n8n and use Grokbot with Claude or Chatgpt?	Yes
how is Grokbot different from Cowork from Claude	it has a simpler interface, but the same tasks can be done in claude with more effort
wt is the diff between AI employee and AI agent	AI Agent performs a task, an employee performs a role/business function
I do have Open AI & Claude Code too	
can one use muse in india through veepn	yes
If I want to create a workflow for creating AI agent, would Grokbot be able to do it along?	It can plan the agent and write its instructions or code. To actually build and run it on its own, it needs tools like a coding environment or a connector to the platform where the agent will live.
What are the equivalents to Grok Bot, bu Open AI, Google, Anthropic etc?	Claude cowork, gemini spark and chatgpt work are the closest

	Personal Suggestion-
can there be some guidance on what tools we should take subscription every damn tool we cannot take subscription share a plan that if you have so and so tools you are good to support your business and execute	Start lean: one paid AI (ChatGPT Plus or Claude Pro) and n8n for automations (if you plan to use automations for real use cases).
	Use free tiers for everything else (Grok, Ollama, Parallel, Firecrawl), and pay only when you actually hit a limit.
Is RAG part of Harness?	yes
do we need paid grok now?	no
Is a bot equivalent to an agent	Yes, pretty much. Grok bot is an agent: the Grok model plus a harness (tools, memory, schedule) that lets it do tasks for you.
Is this bot similar to creating agents?	Yes, pretty much. Grok bot is an agent: the Grok model plus a harness (tools, memory, schedule) that lets it do tasks for you.
so the bot is like a scheduled GPT?	Kind of, but it does more. Beyond running on a schedule, it can use tools, remember things, and take actions, not just reply.
How come every time he's searching, it's going into Perplexity not the regular Google search bar?	That's the default search engine that he is using on his browser.
why is chat disabled ???	Comet (a browser by Perplexity) has Perplexity Search Engine as a default.
Can you build a BOT for personal finance software like Quicken?	It's set to hosts and panelists
Will the bot work like a customGPT	yes
Is creating a dedicated bot is same as creating Custom GPT?	correct but it can also perform tasks
So, if you use Grokbot, firecrawl or Apify is not needed or they are still needed to get a summary of the website or video?	Not quite. A Custom GPT mostly chats with preset instructions and files, while a dedicated bot like Grok bot can also run on its own, use tools, and take actions.
	It may use these, but Grokbot can decide for you or help you decide what harness to use.
Did you see my questions?	
Did you need to customize connectors in grokbot or its preconfigured?	Grok's connectors are preconfigured. It's a finished product, so the integrations are built and managed by xAI. You toggle what's available (things like X data, web search, and whatever partners they've wired in), but you're not building or customizing connectors yourself.
scrapping tool like firecrawl or yt-dlp are inbuilt in Grokbot?	no, they are external tools to add
Am i correct to say that harness helps an AI model to work like its web equivalent?	The haeness uses the AI model to do real work. For example Claude Code (the harness) uses Claude (the AI model) to do work.
so we dont have to provide the youtube channel link or twitter account to the grokbot	not in this case it can figure it out
do we need to install yt-dl in cursor? instead of apify?	you can yes, its a scraping tool for youtube videos
How safe is to plug in these connectors ?	Safe if they're from trusted, official sources (like Parallel's own URL). Avoid random unknown MCPs, give only the access needed, and review what a connector can do before approving actions.
How this groq bot employees differ from the ones we have created during the program?	As you will see, it can do a lot, lot more without needing to build anything. This is closer to Hermes or Openlaw.
Can you please advise on the best platforms/models for automating SEO and also for automating process for Social Media posting on different platforms	SEO: n8n with Claude or GPT for content, plus Google Search Console or DataForSEO for keyword data. Social media: n8n with a posting tool like Buffer, Biotato, or Postiz to publish to all platforms in one step.
What other tools can be used to create an employee bot other than Grok Bot	claude, lyzr, n8n - but all different interfaces
How did he get to Grok Bot?	You can get it to Cursor or here: https://x.ai/bot
u meant Employee as an AI Agent	yes
it went to linkedin as well	
Are Grok and Grok bot the same?	Grok is the AI model which was created by xAI. This is like ChatGPT being created by OpenAI. Grokbot is the system Grok created for building bots.
this grokbot can only be installed on my desktop GPT / Claude?	I think there's a mix-up in the terms here, let me untangle it.
pls update on the questions asked ?	
Brok Bot has the harness is it, we dont need add like GPT/Claude...	Right. Grok bot comes with its harness and model already built in. You don't add or choose anything. It's a finished product: xAI's model, xAI's harness, ready to use out of the box.
Is Grok Free?	no
when you have Grokbot, so isn't it should have that apify api of its own	Grok has its own built-in ability to pull data, mainly from X and the web, because xAI wired that in. But that's Grok's own scraping, not Apify. It doesn't come with an Apify API.
If we have to do project for a class and we have used an api key, do we have to remove it first before submission? If so, how will the tutor check if our model works or not	
do you pay for the api token	yes
ok more agent-native - thanks	
General thought here really, but you guys must all be paying \$100s per month in subscriptions right? its hard to know what to sign up for, any general advice on that?	you have to weigh up the cost of equivalent human labour and time required - the scale is exponential and at a fraction of the price of traditional labour
can this crog bot works on mobile?	Yes, Grok Bot works on mobile devices through dedicated apps for both iOS and Android.
are grok models smart enough? or not taht great?	They are great for software development and automation. But they are not considered as good as ChatGPT and Claude.
If i dont want my site to be scraped by any other tool and maintain my own privacy. How can i prevent it? What are these security tools available for anti-scraping?	Block AI bots in your robots.txt, and use Cloudflare's free "Block AI bots" / Bot Fight Mode for real protection. Keep anything private behind a login, since robots.txt is only a polite request.
If GrokBot is on the cloud, why did we talk of local models and harnesses and not their cloud equivalents? I am getting a bit lost why web version for GrokBot and not for other AI tools.	We will learn local models separately.
why API keys shud not be revealed ?	They are like passwords which allow access to your data and to your money.
do we have option and tell Grok not to use this Search/Scrap and use some other ?	In the prompt, yes
how sell this as a service?	you can offer to set up agents in grokbot for companies
As Grok Bot is on cloud, does all the scraped content or information provided are secure?	Reasonably secure, but it's stored on xAI's servers, so it isn't fully private. Avoid sharing sensitive data, and turn off training-data sharing in settings.
Can someone please lat/recommend all the paid apps we will be needing for this 14 days Bootcamp and for later as it is very confusing (what to download and what not that need payment/tokenvredit card)?	Keep it simple: one paid AI tool (ChatGPT Plus or Claude Pro) and n8n if you need automations.
	Use free tiers for everything else (Grok, Ollama, Parallel, Firecrawl), and upgrade only when you hit a limit.
Grokbot only works once you download it? Wasn't able to find the cloud version	yes
so its good for you know being updated about new ai tools/news being released daily and for looking for any tutorials over X and YT?	You can do a lot, lot more with it, There are people who are running entire one-person companies with Grokbot.
Chatgpt has chatgpt work, grok has grokbot, claude has cwork which is the best one to be using?	its up to you and the task you are doing - grokbot is a simpler interface then others but claude allows more customisation
So, if i am getting it right, i can't use Grok Bot with my own models (ChatGTP or Claude) since Grok Bot uses its own models. This feels like an IDE. Am i right in my understanding?	yes, it uses grok models - its more of an agent building harness
Do webversions of ChatGPT and Claude and other such conversational AI web models, have a harness on their web versions?	Yes, a basic one: web search, file uploads, memory, and connectors are all part of the harness. Desktop and coding apps just give you more control to add your own tools.
I tried the previous harness system (connect 7, parallel search, apify, firecrawl, ytdp) with codex and it was quite quicker, is it better to use codex (may be cheaper, quicker) for such queries ?	yes

Setup Wordpress locally and develop a website and then push it to production	
Research on top Fraud risks around AI injection attacks	
can it be a out boud sales agent	
gym & fitness	
Development in say Agriculture industry in india and other countries	
setup local ai models ?	
As per Dileep, we cannot change a model. Similarly, we need not mention the tools, MCP or any skills to do a job. Just mention the objective. In case of any tools, MCP or any skills requirements, Grokbot will choose on its own. Am I right?	Yes, this will be true almost all of the times. Sometimes, you may need to guide it to do the right thing.
my chat is disabled	Chat is not disabled, but it's set to 'Hosts and Panelists'. So, you don't see all messages.
world war stultion analysis ?	This is to ensure our learners are not distracted due to other's chat messages
E-Commerce & Customer Service	
So you mean we still should have both LLMs?	please clarify
Can we upload RAG to Grok bot? When we want to train the model using specific data, this should be done through RAG. Is this correct?	Mostly correct. RAG doesn't train the model; it looks up your documents at answer time, so you upload your files or connect a knowledge base to Grok bot, and it answers from them.
pl use some business scraper instead	
Create a new bot in Grok is same as crecting a new chat in ChatGPT?	No. A new chat is just a fresh conversation. A new bot is a setup you save, with its own instructions, tools, and memory, that you can reuse again and again.
see my above question that angelo answered	
Do you a note on marketing stack?	
I want to create following for my functions: 1. SEO Agent for Website - Impex website 2. Create a skill for - Audit for Amazon 3. Create a Skill for Social media Audit for various brands 4. Create a skill for creating a brand monitor for various brands 5. Agent which audit Meta, google and other accounts on daily basis and share its findings 6. Voice Agent for customer service 7. Agent to reply for all Redist and Quora queries 8. Agent to reply for each comment on FB / IG and other Social Media Platforms	
a new bot in grok seems to be same as new chat in ai with all harness? which gives better results and does additional work without human involvement	depends on the level of customisation and complexity you would like
Non-technical Delivery manager/Engg manager/Delivery support Manager	
Grok is a replacement of ChatGPT with all the tools and skills installed s Harness?	Not a replacement, just an alternative. Grok is another AI model like ChatGPT; the harness (tools, skills, memory) is what you add on top of either one. ChatGPT was built to give you answers Grokbot is built to execute tasks for you.
how secure is this? i mean i'm giving it access to my data, how can i ensure the data won't be shared with third parties?	Use official connectors, give read-only access where possible, and turn off "use data for training" in settings.
can't i use a GrokBot for doing any automation, why do i need to use n8n flow?	You can for simple, flexible tasks. Use n8n when you need reliable, repeatable steps that run the same way every time, like CRM updates or invoice processing, without the AI improvising.
Does Grok also read documents like CV?	Yes. Upload a PDF or Word CV and Grok can read, summarise, or compare it with a job description. They write down their past experiences, decisions, and real-world examples as pairs of problems and solutions (or question-and-answer pairs), and then run them through a process called fine-tuning.
When people are saying that they train the model using their own experience, how can they do this practically?	Think of it like hiring a smart graduate: you can't plug your brain into theirs, but you can give them a binder filled with hundreds of real cases you handled in the past—showing what happened, how you reasoned through it, and the exact decision you made—until they naturally start mimicking your judgment, tone, and approach.
Can I build the Grokbot for scraping the Business tenders?	Yes, you definitely can do that.
in the example shown , its scraping jobs but can it also apply on our behalf?	Yes, it should be able to do this.
So Grok bot is a better version, but paid version? If you compare it to claude desktop with plugins.	Not better, just different. Both have free and paid tiers: Claude Desktop with plugins is strong for work and coding, while Grok shines with real-time X (Twitter) data. Pick based on your use case.
what are key advantage of Grok over Claude / GPT - is it that it comes with its own inbuilt tool like scraper etc?	Its main edge is live access to X (Twitter) posts and trends, plus fewer content restrictions. Claude and GPT have similar built-in tools (web search, file reading), so scraping isn't a unique advantage.
Can i add skill.md to grok bot? Can i add Remotion or Hyperframe skills for video editing? Say Video Editor bot	Yes, you can absolutely add SKILL.md files to Grok Bot. Because Grok Bot natively supports the open standard for AI agent skills, it reads SKILL.md files identically to tools like Claude Code or Cursor. You can also use programmatic video frameworks like Remotion and Hyperframes to turn Grok into a powerful automated Video Editor bot.
Little lost on this topic, I can try these watching recording, is ask doubt team equipped to answers questions on this topic?	yes, you can post your doubts on 'Ask Doubts' channel.
Will it be having access or will automatically prompt me to give access to particular websites or apps. ?	It will prompt you
How do we build a job scraper using regular Claude ?	Turn on web search, or add the Firecrawl/Parallel connector, then ask: "Find [role] jobs in [city] posted this week, and list title, company, link." Save that prompt in a Project to reuse it anytime.
Sorry i am confused about the ChatGPT and Grok	They're competitors. Two different AI assistants from two different companies. ChatGPT is made by OpenAI. Runs on GPT models. Grok is made by xAI (Elon Musk's company). Runs on Grok models.
thanks	
Grok is the harness, so we add it to ChatGPT?	No Grokbot only allows using the Grok models.
can the job search b not done on chatgpt ?	It can be with the right connectors
Grok = model name GrokBot = task-specific AI agent built using Grok?	That is absolutely correct.
And he is using Grok Bot?	
UNDERSTOOD	
So grok bot is also a kind of agent or a tool for any specific task?	yes
grok employee and chatgpt or claude chat, ideally both are same right?	No, grokbot is an ai employee powered by grok chatgpt is open ai's AI chatbot and claude is anthropic's
besides subcribing to grok bot, there was another platform that Dileep shared that gives access to grok bot too, what is it called again?	That is Cursor. It is an AI coding software which is also owned by XAI.
even after adding harness safety boundaries, what could be reason behind security compromise when happens?	exploits in the harness code
If Grok Bot is like an assistant with a defined role, how does it differ from "Jerry"?	Jerry is limited in it's functionality. It can use the tools it has access to, to perform the tasks it's designed to perform but it can't do general tasks outside it's scope like grokbot
If Grok Bot is like an assistant with a defined role, how does it differ from "Jerry"?	Jerry can use the tools it has access to, to perform the tasks it's designed to perform but it can't do general tasks outside it's scope like grokbot can
how it can access my laptop and can prepare the weekly presentation	Grokbot does not have this capability yet. This can be done using Claude Cowork or GPT Works.
Appears that Microsoft Copilot also has all the harnesses in built - is it so? Why are we not touching upon Gemini and Copilot- are they very bad.	Yes, copilot and gemini have similar built in capabilities but claude and chatgpt are generally more popular than copilot, gemini is a good alternative to chatgpt and for api requests it is the cheapest
can we tell it to use a particular tool? say higgsfield for video gen?	Only if Grok bot lets you connect Higgsfield through an MCP or API. Otherwise it uses Grok's own built-in video tool (Grok Imagine)
Can we automate and schedule the scraper through the grok bot itself	yes

If we use Gork Boat no need to write skill.md ?	That is the case everywhere skill.md works now. You don't need to write them in Claude or Microsoft either.
Which is better to use? Daily office work building content for youtube and instagram and facebook	For daily office work plus YouTube/Instagram/Facebook content, ChatGPT Plus is the best all-rounder, since it handles writing, images, and video ideas in one place
Defined roles	
Can a skill created by Grok be used in Claude and Codex	yes
Is there any alternative for Grok Bot (unpaid app)?	not really no, but you can build your own version using open code
so this skill is only build on valibhar slanty account so i need to create a new skill similar to this if i wanted to focus on other creator ? or this skill i can just input the other creator name in the need instruction and the topic and summart or research?	it's a generic skill that can be used for other creators too.
How to get/suggest the various apt prompt to be given to get desired output from the Harness?	Be specific: say the goal, which tool to use, and the output format (e.g., "Use Firecrawl to scrape X, give a 5-point summary in a table"). Or ask the AI itself: "Write the best prompt for this task."
In the job search example that Dileep is doing, I am struggling the benefit of using GrokBot over other AI models on the web. Please explain what is the benefit of using GrokBot on the web.	The loop that Grokbot runs to achieve your desired goal is much better than other AI models on the web. And their scraping abilities are excellent.
can we build a bot to find scrape websites and find the cheapest airline tickets ?	yes
Does it mean output from Grok Bot is better than perplexity on research?	Not necessarily. Perplexity is still great for quick, cited research, while Grok bot is better when you want it to run tasks automatically or use live X data.
How do we connect specific connectors to specific projects and limit the access for each project?	In Codex or Claude Code, add the MCP inside that project's folder config (e.g., mcp.json), so it works only there. In the ChatGPT/Claude apps, connectors are account-wide, so just switch them on or off per chat.
I think can be achieved using Claude and hostinger	Could you clarify which part you mean to refer on this.
I am exhausting my Codex credit very fast. Will that happen with Grokbot also. I know it depends but relatively I wanted to know	Likely yes, since any agent that uses tools and runs long tasks burns through limits fast. To save credits, keep tasks small and specific, and use lighter models for simple work.
Could you explain the scraper benefit, even for something like a job search (Dileep mentioned it, ut i didnt follow)	Instead of you opening 10 job sites daily, the scraper collects all new matching jobs into one list automatically. Then the AI can filter them, match them to your CV, and even draft applications.
Are you going to provide step by step directions on how to add Bots. Parallel search and Apify? If not provide URLs for parallel search etc.?	
I have seen people use humanizer ai and other such short cuts. Are they skills? How to download them from GitHub and set up the short cuts?	You can just find the github link for them, give Claude or ChatGPT the link, and ask them to install for you. But this only works on the desktop apps where they can do things on your computer. Once done, you can restart he app, open a new chat, and start using them.
what is the URL for the marketplace ?	This is inside the Grok desktop app.
Do we have Voice chat option in Grok ?	yes. It has a voice mode.
In Grok Bot comparison with Chat GPT/ Claude at chat heads are created as at Bot ? can you help to draw the comparison ?	Yes, 'Bots' are meant to help you execute something rather than just answering.
can we store standing core instructions for each bot?	Yes, you can absolutely do this.
can the bot work on local desktop files?	yes
Angelo Outskill 07:22 PM No, grokbot is an ai employee powered by grok chatgpt is open ai's ai chatbot and claude is anthropic's can you explain what is the difference, end of the day they are AI models by different providers, but do the same task with little bit of flexibility. Microsoft Copilot Agents also has templates and Grok also has templates like dr. eggbot. what is the unique in grok bot, pls explain. Correct me if my understanding is wrong.	grokbot has a simpler interface and better user experience
So Harness (Grok Bot) is further harnessed with marketplace Bots.	Yes you can think of it that way. They are created by others and can be used by you, so you don't have to build them yourself.
why I don't see build-in browser in my desktop chatgpt plus plan?	are you on codex or chatgpt? it should be under chatgpt click the + under the chat and scroll down
can we build a bot for trading	yes
what are coding bots?	ai agents for coding apps
so Grokbot is an online version of a openclaw? or kind of hermes?	yes similar
how to integrate a newly created Bot into an existing website	you will need to prompt it to make an api for itself
If I have 5 automatic jobs that I want run each day, am I setting up 5 different bots?	yes
Is Market place in ChatGPT or GrokBot plugin?	It is in Grokbot
can we build a complex multi use connected processes with harnesses without n8n?	Yes, with coding agents like Claude Code or Codex plus MCPs and scheduled tasks. n8n is better when you need visual, reliable, step-by-step control that's easy to monitor.
what is the benefit of grok bot over chatgpt codex? Is the only difference limited to installing the right plugins, requirements etc? If we get those skills and setup in codex, can we build same bots in codex?	The fundamental difference is the environment and execution model, not just plugins. Grok Bot acts as an autonomous workspace teammate that runs inside a persistent cloud computer, allowing it to natively control browsers, record GUI macros, and deploy multi-agent teams that work 24/7 even when your laptop is closed. In contrast, ChatGPT Codex is a highly specialized developer agent designed to operate inside a sandboxed codebase to refactor code, run terminals, and manage pull requests. While you could theoretically code a custom OS-wrapper around Codex to mimic Grok Bot, Codex lacks the out-of-the-box virtualized desktop environment, native browser-automation layer, and multi-agent coordination UI required to seamlessly run business-workflow bots.
CAN YOU PLS GIVE AN EXAMPLE	example of? please clarify
I have seen our instructions using Comet browser. Is it beneficial? How will it be worth compared to regular browsers with Plugins like emily?	its just an alternative - but now claude can do what comet does
I really appreciate Jitesh- I am watching him since day 1 he genuinely solves customer issue fantastic person to work with!	thank you for being a very active learner.
May I please have a response to my query..many thanks I am honestly missing the big picture. This is honestly confusing - if I use Grok Bot, is there a reason to use chatGPT/Claude? Is there a reason to use Codex or Claudework? If Grok bot is creating harnesses under the hood, why do I need a marketplace (which brings me back to ChatGTP + plugins). So I am definitely missing the big picture. Can you help me understand?	Kowshik, while Grokbot will build everything for you, you will not see how anything is being done. Which means you lose all control over how your systems run. This is fine for finding jobs, but not so great for critical work.
can someone explain what happened in last 20 mins ?	We saw an example of a Grokbot for job scraping. You can use Zoom AI Companion on the top on Zoom App to ask it to summarize.
The grokbot created... is this usable only via grok or other agent as well? I am guessing this will require setup and exchange of API key?	it only uses grok
my apologies jitesh for asking questions like this everyday pls dont mind to entire outskill team.	
How can I see what all the harness available default in grok bot?	Open the bot's settings/tools section to see what's enabled. Quickest trick: ask it directly, "What tools and capabilities do you have?"
YES WE ARE NOT CLEAR	
What is the reason to make harness invisible?	Companies are doing this to make AI usage seamless and non-technical. You can now use simple English to do real work using AI because of this.
can grok bot do all the things what chatgpt or claude can do	no, but claude and chatgpt can do all the things grokbot can do
Can we train Gemini with same harnesses?	You don't train it, but yes, you can connect the same tools. Gemini CLI supports MCPs and skills
Thanks	
but chatgpt and claude we need to connector and skill and Grok has inbuilt harness so isnt it better?	
If I subscribe for Grok Bot, still I have to pay for like Apify, etc. Right?	Yes, you would still need to pay for Apify.
Can we use these harness for workflows as well ?	Yes. In n8n, the AI Agent node is the harness inside your workflow, and you can add the same MCPs (like Parallel or Firecrawl) using the MCP Client tool.
can grok bot do all the things what chatgpt or claude can do	

for claude should i go with chat or cowork in case i need to use connectors	Rule: need an answer that pulls from a connector → Chat is fine. Need the connector to actually do a job across steps → Cowork.
Please explain how Workflow (e.g.n8n). LLM, Bots can be unified in one story	Here's the one-story version. Think of it as a body.
	The LLM is the brain. It thinks, reasons, decides, writes. But on its own it's a brain in a jar: smart, but it can't do anything. It just sits there and responds when spoken to.
	The harness turns the brain into a bot. Give that brain memory, tools, and a loop, and now it's an agent: something that can take a task, use tools, and act. A bot is a brain that can move its hands.
	The workflow (n8n) is the nervous system and the calendar. It connects everything and decides when things happen. It listens for triggers (an email arrives, a form is filled, it's 9am), routes data between steps, and calls the bot exactly when it's needed. The bot is smart but reactive. The workflow gives it timing, structure, and reach across your whole stack.
By using diff Tools in Grok we can create Image and video etc ?	Yes, you can definitely get it to do this. But creating these may cost more.
Dileep said we can add context in chatgpt as help for vibecoding. But don't use lovable and bolt for vibecoding?	chatgpt and claude can also do vibecoding like lovable or bolt
Is there a usage limit in Grokbot, like ChatGPT and Claude have their usage limits?	yes
Are these scrapers capable of cracking captcha also	Sometimes, but this is not guaranteed. You can't rely on this and build systems around assuming these will get through.
Can we have multi-bots in Grokbot like multi-agents in other models	Absolutely ManoJ, and that is when these systems become really powerful.
Which is better to use? Daily office work building content for youtube and instagram and facebook	Grokbot would be able to do this really well.
Could I do this in Claude + Firecrawler via connector? What is the benefit of using GrokBok here	You can do this easily in Claude or ChatGPT too, which have build in browser use to do it.
when to use dr egg bot	It's a bot that lets you create other Grokbots
can a bot created be incorporated in n8n workflow?	Currently no
is Grokbot has its own memory ?	yes
is it right to understand that adding tools and skills as harness make the AI Agent as Chatgpt or Grok smarter, faster and more accurate?	correct
where do you pay for tokens, or which one will start charging ?	for grok? its a grok subscription
i can install localay ?	grokbot app? yes but its still linked to cloud
from grokbot it seems like earlier one had to build an automation for job hunting and application. now in grokbot one need not build such automation. the bot itself is able to hunt, apply, schedule runs	Yes, that is correct. This is why a lot of automation is moving to using AI. The downside of this is very high token usage and cost.
will a heavy context also operate with grokbot? what is its context window?	
What is the difference between a Bot and an Agent?	For Grok bot, they're basically the same thing. "Bot" is just Grok's name for an agent
I have installed grok bot on laptop when I fire a query and shut off my laptop, will it still be running on cloud	yes.
what is the difference between using a "scraper" and just asking claude or chat to pull information for any specific search details	
Can Grok help in building a seamless effective process involving multiple domain and functions? If not, please suggest the ways to do the same	
If I am vibecoding an app can I somehow connect to grokbot for input and have it live sitting there and be able to answer any questions?	Yes, but through the xAI (Grok) API, not the Grok bot itself. Add the API key to your app, and Grok will sit inside it and answer users' questions live.
but if we build resumes and letters using bots and AI, dont the companies filter the AI ones out?	
How do I see Grok Bot and Dr. Eggbot. Both are doing the same - building bots. why am I calling (marketplace install) of Dr. Eggbot within Grok Bot, what value is Eggbot adding to Grok Bot?	Dr. Eggbot can build better bots for you with less prompting effort. It has better context.
Can Grok generate images/reels?	Yes. Grok Imagine creates images and short videos, which work well for reels; you just add music or edits separately if needed.
Is Maeket Place another platform?	No, It's a Marketplace within Grok app.
is it possible to monetise these bots? and how to bring it out to the customers outside ?	
Which OS is used by Grokbot when assigned a task?	Grok doesn't expose an OS to you. When it runs a task, it executes inside xAI's own cloud infrastructure, which is Linux-based server-side like essentially all these AI systems, but you never see it, choose it, or touch it. It's abstracted away. You give it a task, it runs on their machines, you get the result.
Can it be linked or built for customers?	
When you are inside Grok Bot and it is a specific employee with specific duties. If you need it to do something outside of those duties to complete the task, you need to create a new employee bot that will handles that specific task. just like how a loan goes. Originator, to processor, to underwriter each one working on the same file but handling thier specific work?	
Is this screen of GrokBot or ChatGPT ?	grokbot
what are analogies here ?	Analogies means giving a real-life example of a complex technical term.
How did we create a group chat in this Grokbot?	For example- we call 'API' as a "Waiter". This is an analogy.
for building a flight ticket tracker app i can use apify to scrap price from the live website like makemytrip or other emirates flight websites?	Apify has scrapers for Google Flights and Skyscanner, but sites like MakeMyTrip or Emirates often block scraping. For a reliable tracker, use a flight API like Amadeus, Duffel, or SerpApi's Google Flights API.
How did the Bot managed to build resume for Dileep? Do you mean it scrap his job skills and educational background? did not see Dileep upload his resume?77ks	Dileep prompted information about himself and also shared his LinkedIn profile.
Do I need to install GrokBot on my local first before connecting to ChatGPT?	Grok Bot doesn't connect to ChatGPT; they're separate tools.
only paid version is having creating geok bot?	Yes, it's paid only.
Is skill equivalent to memory of what we discussed earlier	No. Memory is what the AI remembers about you and past chats, while a skill is a saved set of instructions for doing a specific task the same way every time.
and is it available only for paid ChatGPT?	It has nothing to do with ChatGPT's plans. Grok Bot needs its own paid plan
Trying to decipher the applications of Grok Bot. Please help in deciphering its broad usages	Think of it as an AI teammate that works on its own computer in the cloud. It's used for work like inbox and CRM management, research, sales outreach, reporting, expense processing, recruiting, and marketing.
I am getting this when I say search jobs for my profile across sites:	
Worst news first: scraping LinkedIn or Naukri directly (logged in, automated) violates their Terms of Service and can get an account flagged or banned — so "search jobs across sites" needs to go through official/semi-official channels (job board APIs, RSS-style aggregators, or MCP servers built for this) rather than a bot driving your logged-in LinkedIn.	That's the AI correctly protecting your account. Instead, ask: "Search public job listings on the web (Google Jobs, company career pages) for my profile," or use each site's own job alerts, or Apify's job scrapers.
Market place I meant	
We could also build this ourselves right? Following the Jerry playbook.	yes, you could, it takes some more effort to build this on n8n.
If I want to sell a bot based on grokbot, how can I wrap this and sell this to a company for example. Whatever we see here is in my own account. Does this mean that „I need to open a separate accout for a client and make a bot then? How if I want to incorporate that bot to a website?	
not clear on steps to connect claude to github, do we have any link that explains that step-by-step?	It can be connected through Connectors option
I don't know about the rest but this is going over my head (bouncers)	Sriram, we can just telling Grokbot what we need to do, and it is spinning up bots to do the work for us. This does not need us to add context, connectors, etc. It does everything for you.

	Good instinct to notice it. But no, it doesn't negate what you learned. Here's the honest frame. Grok feels more powerful because it's finished. Someone already did all the wiring for you. That's exactly why it's impressive out of the box and exactly why it's limited. You're driving a car you can't open the hood on. What you learned is how to build the car. That's a different, higher-order skill. Grok is one company's finished product. What you built transfers to any model, any tool, any task you'll ever face. Grok can't be pointed at your specific client's weird workflow. Your own build can. The real lesson isn't Grok vs your build. It's the pattern underneath. Grok is just proof of what a well-assembled agent can do. You now understand why it's powerful (model + harness + connectors + memory), which means you can recognize, evaluate, and build these systems, not just consume one.
Doesnt this (grokbot) negate a lot of what we've learned so far. This is so much more powerful for a non technical person. I realize chatgpt/claude has more flexibility, but the 'skill' of grokbot is blowing me away. Thoughts?	
Use case: A person submits a form that requests to use a particular service offered. The data is to be collected via a web form, input then stored in a google sheet. An email gets sent to the service provider telling them there is a new job and sends an email to the person making the request. A bot then analyzes the spreadsheet every day to create the work for the day. The service provider will update the spreadsheet by client. What tools would someone use to build this?	Use a form (Google Forms or Tally), then n8n to save the entry to Google Sheets and send both emails via Gmail. Add a daily n8n Schedule trigger with an AI Agent that reads the sheet and emails the day's work plan; the provider just updates the sheet directly.
	yes
grok bot for paid users only?	
Has he created what some people call a model council?	
what was the linkedin scraper again	
how can multi agent system can setup in grok bot?	Create several Bots, each with one job (e.g., researcher, writer, reviewer), then put them in a shared thread or group chat so they can hand work to each other. Bots can share project context and work together on the same task.
Can I use GrokBot in Claude as I have paid membership with Anthropic?	No. Your Claude membership doesn't cover Grok Bot; it needs its own plan (SuperGrok Heavy, Cursor Ultra, or Cursor Teams Premium). With Claude, you can build similar agents using Claude Cowork or Claude Code.
How do I attach the screenshot here ?	Pakhi, you cannot attached screenshots inside Q&A.
what is leh function of egg bot here	dr eggbot creates new bots based on the requirements you give it.
Never mind I've seen that it's part of Grok.	
so that mean its grok general model answering not the bot with probably connectors connected	
Can I create agents for some sub-functions for marketing, put up some managers for overall function as well who gives me report on daily basis using Grok Bot?	Yes, you can.
If I have to leave aside the cost part, can workflows like gtm which are done in n8n, can grokbot handle end to end within itself?	yes, it can, but if you want to use external apps, you need to check MCP availability.
I think the Grokbot has a Chief of Staff connector	
what on the link of the interface the bots are added in the session. Link please	https://x.ai/news/introducing-grok-bot
does the grokbot work on token models or no of bots used.	It runs on your subscription plan (SuperGrok Heavy or Cursor Ultra), not per bot. Usage limits still apply, so more bots and longer tasks use up your limit faster.
do manager give task to employee similar to human, every day	yes you can set it up like that
@samrudhi moskal - Thankyou. Fantastic answer. Btw, great office hours session today. I understood only half of what you stated. 8 days back - I would n ot have understood anything!	Thank you Thomas. Keep showing up. It compounds :)
I am practically new to this AI world. It would be best if we are given alternative unpaid/free boot tools for learner like me.	
Thank you. Pardon me. I had an eye operation so my focus is a bit poor. The text seem a bit tiny for me.	
This looks very much like n8n workflow with the orchestrator and AI agents :)	Yes! All multiagent systems work very similarly under the hood.
can this chief of staff process work the same way on codes?	yes, it can.
Can they handle quickbooks, and are that secure or just they are for just basic works only	they can do accounting yes but will require human review
What happens when u need another JCB, will the chief creates a new or should I do that before giving the instruction	
Which Grokbot plan is currently being used here	It needs Super plan or higher
can we use this agents with n8n for automation?	yes, using xAI's APIs (these are APIs for Grokbot)
New ?? How is creating multiple agent "employees" different than creating multiple Harness "employees" Is it just that a focused Harness has multiple agent with targeted skills so the quality of the work is higher?	yes and the interface is more user friendly and simpler
Security wise on issues?	
do we need to specify the cmo skills or just I have to say create cmo bot	The more details you give jay, the better will be the results always. This is true for everything in AI, Generic prompts will get generic outputs.
so, why you need to setup a chief of staff is because you don't need to look for a specific bot, but you can just prompt and the chief of staff decides which bot will do the job, am I correct? If I don't have a chief of staff, I have to search for the appropriate bot myself to do the job that I want.	
	It's a specialized grokbot that lets us build other grokbots easily.
why choose dr eggbot, not others?	
how is the writing is it human or ai	
Can you put all these Grok Bots into an n8n workflow or similar to generate content, documents, whatever you are trying to accomplish?	Not the Grok Bots directly, since there's no n8n node for them. But you can build the same setup in n8n using the Grok (xAI) API with multiple AI Agent nodes, each doing one job.
can we ask dr eggbot to everyday add skills to all teams and bots?	sure yes but may have reverse effects
I have query. On first day Deepseek taught us about Goal-Audience - Context Driven Framework for prompting to get the best result. Today though I see him using shorter prompts. Can you share reason on where should we transition in this regard without losing quality output	Abhishek, you want to ideally give more details to get better bots. However, this is a demo to show you how to use grokbot. Here also, if you give more details, your bot would be far better.
So this is the easy way to make a 'jerry' like version, but cost more. right?	yes.
AI like? can it be posted directly from marketing bot	
what are the best tools available for paid ads	
marketing in the grok bot cos i dont have an account	
Where is Context? and parallel search used in our scenarios?	
lent this same as a Perobject in Chat GPT ?	
any limitation on number of bots to deploy?	
Is the grok bot free to use? Or is it paid one?	It's paid.
can you have one employee build lesson plans, then another employee to build video for those lessons?	
how to calculate token in Grok bot ?	There are online counters like Grok Token Counter for Grok models and for grokbot you get a weekly token pool based on your subscription plan
can Grokboard create dashboards and visuals in Power BI. ?	through api yes
If I provide a PRD with what I ultimately want to build, would Outlook be able to review and provide input on recommended tools to use to build the entire process.	
I have 2 questions - can you improve Dr Eggbot further by adding skills? And 2) what are some other useful bots in grok that could be useful to know about (like Dr eggbot)	
i mean can i link meta ad account and get the grokbot analysis for my campaign and ad build.	yes, you can add custom mcp
can we get a skill - master skill generator ?	
Dont we have to pay to grok bot and its expensive?	Yes you have to
or master prompt which generates the skills	
how does this grok bot system compare with what we have learned about master agents & sub agents? is this better?	
Can Grok be used as an end-to-end coding assistant to build a fully functional mobile app from scratch, comparable to Claude's capabilities?	Cursor, which mainly uses Grok models can do this. And it is comparable or sometimes even better than Claude Code and Codecx.
can we connect these agents to n8n for automation?	
How can I bring in a bot/employee that I have built outside. Eg. Voice AI assistant we built in n8n so I am not redoing it in Grok Bot again?	

This Jitesh.	
so could I use Grok-bot to run an n8n flow equivalent? E.g. Scrape trending social media, adapt my messages for an IG post video. Produce a video with my avatar (generate images, sounds etc.). Render them and produce output?	
is it true that, with using Grok bot to create a team of agents, that means we do not need to use n8n that we learnt past few days?	Lean, we use n8n for automating tasks where we know how work should happen. The big benefit is, once the workflow is setup, there is no cost or very low cost to run them. With Grokbot, etc, it can get very expensive very quickly.
Y	
'We now have manager bots... Is there some guidance on how many bots per manager bot? (any span of control, flat org vs what hierarchy is best?)	This is mainly about experimentation. There is no one best answer here.
@jitesh, @luca: @jitesh, @samudhithi @karam- Guys - thank you for your mentorship sessions over the last week. Really good session - each person has different strengths - but you all were patient, tried to address questions & there were a lot, and tried to bring us along. I struggled in a few sessions - but felt better for having gone through it. The only 1 session I could not finish successfully was VVoice Agent. But still, I'm thankful for your patience	
how to calculate token in Grok bot ?	You don't need to calculate it; Grok Bot runs on your plan, and you can check usage in its settings. As a rough rule, 1 token ≈ 3/4 of a word, so 1,000 tokens is about 750 words.
What do you mean by local models???	A local model is an AI model (like openAI's chatgpt) that runs directly on your own PC instead of on a remote cloud server
If I use local/open source models in chatgpt by adding them, would it still charge credits on chatgpt?	No but it wouldn't run on chatgpt
Other than Job search, how to use Grok for business usages to create a seamless efficient delivery model involving multiple functions?	Give each function its own Bot: one updates the CRM from call notes, one handles follow-up emails, one processes invoices from Gmail, and one sends daily reports. Connect them in a shared thread so work flows from sales to ops to finance automatically.
Can we run these open-source models on Claude?	no but you can try open code
Why does one need local model?	it can be hosted for free and your data never leaves your pc
can we add those additional models in Codex via Openrouter instead of Ollama?	yes
Is Ollama similar to Perplexity an aggregator of models ?	No it is different, perplexity is a cloud based ai search engine and aggregator and ollama is a local inference engine and model server
Claude / Perplexity / ChatGPT: You use an AI service running in someone else's data center. So local LLM is for privacy, sensitive data? Ollama: You install a small "AI engine" on your laptop or desktop, download a model, and the model runs locally. ?	yes it does use alot of ram
Does it chomp up a lot of RAM	
What is the system requirement to run Local LLM models?	It depends on the model, different models have different requirements Two different things. One is what the model is, the other is what the model processes. Parameter = the model's internal knowledge. The learned values (the dial's) set during training. Billions of them. They're fixed once training ends. This is the model's brain. "Llama 70B" = 70 billion parameters. Token = a chunk of text the model reads or writes. Roughly a word or piece of a word ("orchestrator" might be 3 tokens). Every input you send and every output you get is measured in tokens. This is what flows through the model. The clean way to hold it: Parameters = what the model knows. Baked in. Never change during use. Tokens = what you feed in and get out. Change every single time.
so the higher the model in ollama, the better it runs?	No, a larger model does not automatically run better or faster in Ollama. It usually runs slower and requires more hardware memory
Why only half the VRAM size... does it need 100% overhead for context?	Its just better to maintain optimal performance of the model
why half ram	Its just better to maintain optimal performance of the model
this would not support 8 gb ram	the 2b model will work on 8gb
if we run the models locally how would it connect to cloud for research and stuff how can it do scraping?	Ollama has the option to allow these to connect to the internet.
is libre-chat similar?	yes
Should I use "No thanks, I'll use Ollama locally" ?	yes
whats gemma actually? Is it an AI model then why not claude or other popular ones	a family of lightweight, open-weight artificial intelligence models built by Google DeepMind using the same research and technology behind the Gemini models.
Do we need just RAM, or CPU/GPU/VRAM also to be checked?	depends on how you want to run it, but generally just ram for simple setups
Any specific reason for using 50% of available ram can it be 70% or 80%	
Second: The ram capacity is the ddr4 ram or GPU Ram as well??	There's a risk of crash or slowness, hence it's better to keep less.
Where does it say in Ollama if the model is a local model or a cloud model?	under the chat it says cloud if cloud model the rest are local
The ollama setup should have been in a workbook that we could have preloaded.	
Can we also use Claude models like sonnet in ollama ?	no
can we use nemotron in ollama?	yes
How do you know how much RAM you have on your computer?	depends on your computer - but on windows in your search bar search for "system information"
Beyond aligning model size with your computer, how do we select which model to use to align with the function (research, scraping, etc) we are building in Bot?	Gemma (by Google) is small, runs well on normal laptops, and handles everyday tasks well. Quick guide: Qwen for tool use and coding, DeepSeek for reasoning, Llama for general use, and Mistral when you need speed.
how many models should ollama have? sign-in to ollama or use local?	Keep just 1-2 models, since each takes several GBs of space. Use local for free and private work; sign in only if you want Ollama's cloud models to run bigger ones your laptop can't handle.
Why Gemma? Can you give us guidance on the various models?	Gemma (by Google) is small, runs well on normal laptops, and handles everyday tasks well. Quick guide: Qwen for tool use and coding, DeepSeek for reasoning, Llama for general use, and Mistral when you need speed.
How to select which model is good ?	Based on your machine's hardware (what's the best it can run) and what type of task you need it to do. You can also research which is best for your purpose using perplexity.
Is the benefit only privacy?	privacy and cost
When do we need Ollama model? Please give a few use cases.	Data sensitive projects (where clients require you to ensure their data is managed and processed carefully) or to optimise cost.
same process for claude too?	
Is there a way to directly download in terminal instead of using ui	Yes, you can.
why are we downloading models here ?	just teaching how to install local models, they are free and run on your local pc
How do we delete the model (ollama) if we do not want in the future?	You can easily do this from within Ollama. You can also delete the files directly from your computer.
Why does one need to install this model ?	To use these models for free.
if I have 64gb ram... I can go upto 28b, correct	yes
and how do you use that installed model in chatgpt ?	There's a setting on Ollama Desktop app to enable on ChatGPT desktop app.
So is ollama app then locally hosted and then I can download models to locally host? is this creating my own LLM model for local and will have no privacy issues?	

How many models are there in Ollama?	Hundreds, and new ones keep getting added. You can browse them all at ollama.com/library ; popular picks include Llama, Qwen, Gemma, Mistral, and DeepSeek.
Is the knowledge base of the local models are in the same range to that of popular models	No. Local models are smaller, so they know less and reason less well than top models like GPT or Claude. They're good for simple tasks, privacy, and saving money.
Is ollama the same/similar to omni route?	No. Ollama runs AI models on your own computer, while OmniRoute is a router that sends your requests to different cloud AI providers (like OpenRouter). One runs the model; the other picks where to send it.
do we need paid subscription for AI notes ?	If you mean Zoom's AI Notes, no -you don't need a subscription.
which models have recursive learning enabled?	Ollama runs models locally for inference (using them). It does not train or update their weights as they run. Models in Ollama are static. They don't learn from your conversations. Every model is frozen at its trained state.
what are these model	these are open source models that run on your local computer, and it works for free.
if you are downloading several of these and you need it to be 1/2 the size of your ram. wouldnt downloading the multi models that it would slow down your computer? or no...because you would be running them one at a time?	
Why does one need these models ?	these are open source, free models that you can use without any subscription.
when we want to install Ollama - in the installation it asks us to choose from a bunch of apps - which one should we select?	That screen is asking which app to connect Ollama with. Pick the one you'll actually use (or skip for now); you can always add more later.
I have antigravity which will give similar output	
no but what's the importance of models here ? @john	local models are used for companies that don't want their data ever leaving local pc like banks. it is also free as its running on your own pc, in this case he is showing different local models that can be downloaded
do you have to signup for Ollama once you download the desktop app?	yes
Q on Ollama - Dilip started with saying Ollam cloud. However, these (what's downloaded) seem like desktop models on my local station - can you confirm?	Thomas, Ollama has two modes. One is where you can download and run these models on your computer. Second is cloud where they have all these models hosted on their own servers, and you pay them a subscription fee and use these models without downloading them.
I installed Ollama app and when I open that app it does not launch as what is being shown	it may be because he has a paid subscription
Ok so private and cheaper but less powerful. Do you pay for the tokens via Ollama?	No, you don't pay for any tokens.
How they got updated? or I have to download if new version or advanced models are released by the AI company?	
What is the benefit of using Ollama with CLoud models? Why cant we just use Chat GPT and Claude instead?	Data privacy (your data only gets processed on your pc). And cost (if running api requests at scale)
Ollama is another alternative to Chatgpt etc?	yes
Not clear...why should we consider Ollama?	its local, the models are hosted on your own pc so no api costs and no data training
what are cloud models? why to us them?	they are bigger models hosted on the cloud that are more powerful and too big to run on your local pc
After I download in my device?	
Do we need ollama account or local only?	we need Ollama account.
Ollama + Cloud model = Open Router???	Similar idea, but not the same. Both let you use cloud models with one key, but Ollama Cloud offers only open models, while OpenRouter also gives access to GPT, Claude, and Gemini.
what's your take on Z.ai?	It's powerful and cost effective but there is some concern about it's reliability
what purpose do these models serve	You can host locally on your computer and use for free.
can local model be hosted on AWS?	yes
Can we get the videos of him using the models when he gets OFF Zoom so it doesn't crash?	
I said Hi on Ollama and it comes back you've reached usage limit :)	you need to use a local model not a cloud model
So hosted cloud model in Ollama is much more secure than GPT and other cloud models?	No, a hosted cloud model in ollama is not more secure than gpt or other major cloud models
Can these local models be used with connectors / plug-ins also	yes, they can be. not within Ollama
Can n8n able to use local model?	yes it supports ollama
When do we use Ollama?	When you want to run open weight AI models locally on your own computer instead of relying on external cloud apis
How they got updated? or I have to download if new version or advanced models are released by the AI company, after I download it in my device?	You download updates yourself. Run "ollama pull model-name" for a newer version of the same model, and a brand-new model is a separate download.
What type of workflows or work require what amount of billion parameter models?	Rough guide: A. 1-4B: simple tasks; classifying, tagging, short summaries B. 7-14B: everyday work; email drafts, summarising, basic tool use C. 30B+: reasoning, coding, and agents that need reliable multi-step decisions
Is Ollama an agent or LLM?	Ollama gives us a way to run LLMs.. But, their desktop app has LLM + Memory. No Connectors/Tools yet.
Do we need to keep updating local models to get updates?	yes, they do not auto-update.
so cloud models are still private ? like output still doesn't go to any database?	No. With cloud models, your prompts and outputs go to the provider's servers and are stored there. Only local models keep everything on your own machine.
Thanks Ritesh	
how to decide model size given aws cloud ram is huge	When using online models, you can use absolutely any open models. There is no restriction. However, very large models would get very expensive.
so then we pay Ollama instead of all the platforms separately?	yes, you can.
Can I use Open router for using cloud based models offered by Ollama?	They're separate services, so Ollama Cloud isn't available through OpenRouter. But OpenRouter has the same open models (Llama, Qwen, DeepSeek), so you can use those instead with one API key.
Will the models get automatically updated once locally installed or do I have to periodically go update the model?	You have to update them yourself.
Hence, please request team to access the Doubts section in LMS	
to clarify, at the beginning Ollama has no models in it?	yes, you have to install a model from scratch
I have shared the error and the screenshot there	
Is there any API to connect with local models?and how to connect?	It is not directly an API as such. But yes, you can connect to local models. It can be a little more work, but it is definitely possible.
what are the benefits of cloud vs local models?	cloud supports bigger models that your pc cant run - local supports data privacy
y	
Appreciate your support and help...many thanks	
me	
When Ollama is used to download cloud models, will we see the cloud model names when we are using Claude / ChatGPT in the model area?	No. Claude and ChatGPT only show their own models. You'll see the Ollama cloud models in Ollama only.
Is it possible to use Grok Bot with Gemini Notebook?	No. Grokbot only works with XAI's grok models. You cannot use any other models.
ollama appears to have memory between models. can you explain how that happens?	That's the Ollama app remembering your chat history, not the models sharing memory. When you switch models, it just feeds the earlier conversation to the new model as context.
Can Antigravity also get cloud and local models installed?	Antigravity comes with cloud models built in (Gemini, Claude, GPT-OSS). Local Ollama models aren't officially supported there as far as I know.

local model only reply from local memory and does not connected with Internet?? so we can not search online with these??	Correct, by default they only use their own training knowledge. Give them a search tool (via MCP/Connector) and then they can search online too.
so cloud models are still private ? like output still dosent go to any database?	No. With cloud models, your data goes to their servers and is stored there. Only local models keep everything on your own machine.
im getting a different interface compared with dleeps it just gives option of terminal and launch command	Yes, you may need to run the terminal command once, then restart.
Seems crazy OpenAI let us do this to ChatGPT, sadly my laptop isnt powerful enough to make much use of this. in ollama i shud sign up or click the option i will use ollama locally	You will have to sign up even after you download it locally
Thanks Jitesh , but what pupose do these models serve , why do we need these models when Chat GPT / Claude have thier own LLM Models ?	Three reasons: they're free, they keep data on your machine, and they work offline. Use ChatGPT or Claude for hard tasks, and local models for simple, high-volume, or sensitive work.
whats the use of local model?	You run a local model when privacy, cost, or control matters more than raw power. Four real uses: 1. Privacy and sensitive data. The data never leaves your machine. Legal, medical, financial, client-confidential work where you can't send information to a third-party cloud. This alone justifies it for a lot of businesses. 2. No per-use cost or limits. Cloud models charge per token and cap your usage. A local model is your hardware. Run it a million times, no bill, no rate limit. For high-volume repetitive tasks, this saves serious money. 3. Control and reliability. No company can change the model, raise the price, or shut it off. It's yours. It works offline. It won't change behavior overnight because a vendor updated something. 4. Customization. You can fine-tune a local open-weight model on your own data and own the result completely.
This is by far the most confusing session of the course.	
so local models are my brain in work flow. which are free are lees important works such as reading gmail etc.	correct
if use local model in chatgpt, then usage will drop or become zero?	Yes for those tasks
Oh, but i could use the cloud versions without heavy laptop impact?	correct
how many model we could install in a 8 gm RAM system?	One small model, e.g gemma 3 4B or Phi 4 mini
Can i install Ollam local model within my Azure App Server and access remotely from my ChatGPT desktop?	yes
So the benefit of doing this is it doesn't use credits but keeps your setup?	yes
having it connected to ollama, will chatgpt still remember what it has learned during my other chat?	Yes, it will.
Does this mean we can use this local models from ollama through chatgpt withn worrying about credits reaching its limit?	That's right.
Using Local Models by connecting Ollama to ChatGPT and using them in Chatgpt will avoid using tokens of ChatGPT?	Yes. When the reply comes from a local Ollama model, it's free and uses no ChatGPT tokens.
And, how do you set up the harness in ollama, or is that being done in ChatGPT and then you just select the ollama models available?	yes, that's correct.
can we change "pilot" (model) halfway through a "flight" (conversation)?	
Can i install Ollama on F Drive? My C Drive is 75% full. I have 16 GB RAM. Please advise.	yes sure
can i configure openrouter to chatgpt/claude desktop app or only ollama works this way?	Not through the desktop app
how does it affect the token costs when he uses another model on chatgpt to another like kimi or whatever?	
can we use Codex+local model for scrubbing data?	yes, you can.
given the RAM restrictions, it is better to download the models in a separate system such as Mac Minis?	yes, that is why people do it, also so that it can run when their pc is off
Any image generation models in Ollama? Generating posters or social media carousels?	Ollama now has basic image generation (e.g., FLUX and Z-Image models), but it's still early and needs a strong laptop.
its asking me to run terminal instead of opening chat in ollama	Yes, it may ask you to run one command on Terminal first.
Isn't LM Studio a better version of Ollama, or better than Ollama?	Not better, just different. LM Studio is friendlier with a nice visual app for browsing and chatting with models, while Ollama is simpler to connect with tools like n8n
do these local model cost money too , like we have to recharge them like as api key	No,they work for free.
So, if we install the local model, does this mean that i might need to reinstall a newer version with similar size in the future to make sure that the model is updated?	yes
are these models for doing different tasks like voice, video generation etc or are they just the processors only? Why do we need so many different models..	Most are text models; a few also read images, and some handle voice. So many exist because each one is tuned for something different: coding, reasoning, speed, or small size for weaker laptops.
Where do i see the list of these tools which we have installed through prompts? Is there a single place i see all these harnesses? - i want to know whether the same can be checked in ChatGPT/Codex as to what is installed at one place	In Codex, type /mcp to see connected tools, and check Settings → Plugins/Skills (all saved in ~/.codex/config.toml). In ChatGPT, go to Settings → Connectors (Apps) to see everything connected.
i was under the impression that the Chinese models may not be as safe when it comes to data privacy	If they're running locally on your computer, you do not need to worry about data privacy because the data never leaves your computer at all.
if i get a large local model (that exceeds my laptop's RAM) but store the model on a hard disk or a cloud server, can i make it work?	Rohit, you can not run a model larger than your available RAM as it will crash your computer immediately. You can do this on the cloud.
Best Way to check how much ram is already in use to decide which local ollama model should i use?	Mac: Activity Monitor → Memory tab. Windows: Task Manager → Performance → Memory. As a rule, 8GB RAM runs small models (around 3–4B) and 16GB runs 7–8B models comfortably.
for imej edit and make poster can we use local model	Possible, but hard. Local image models need a powerful GPU and are tricky to set up
Would it be a good idea to download all the transcripts of the AI accelerator program and use Ollama as a mentor (in ChatGPT)? To summarize, give action points etc	FLUX and Z-Image models
Im getting a different interface compared with dleeps it just gives option of terminal and launch command	yes sure
Do we have breakout room session today?	yes, no workbook, only Q&As
if i connect Ollama & model kimi 3 in my chatgpt, and in the same chat i sometimes use chatgpt models and for less complex questions i use local kimi 3 model, will all the data go to chatgpt even though kimi 3 is a local model?	No Saloni, only the queries you route to ChatGPT will go to them. The rest stay local.
What is the difference between a cloud model and a local model? Why are we using the cloud model in ChatGPT?	A cloud model runs on the company's powerful servers, while a local model runs on your own computer. ChatGPT uses cloud models because they're much bigger and smarter than what a normal laptop can run.
so basically we can use local models in chtgpt using ollama	correct.
Can i add multiple cloud models from Openrouter (instead of Ollama) to ChatGPT? Will it allow to select various models in ChatGPT seamlessly like Ollama?	No, ChatGPT does not support OpenRouter models.
if plus credits get exhausted. Can we give open router key and use it directly?	No, most tools like ChatGPT, Claude do not support connecting with OpenRouter key
wt do i mean by skills here	A skill is a saved instruction file (skill.md) that teaches the AI how to do a specific task your way, like writing emails in your tone or making slides in your format.
it works for projects also only for chat?	works for projects too.
AI AGENT AND AI EMPLOYEE	
in Chat GPT , only gemma4 is showing , other models are not showing.	Only models you've downloaded will show up. Run ollama list to check, download others with ollama pull model-name, then restart the app.
TO UNDERSTAND THE DIFFERENCIATION	
Thanks Jitesh Deepak has answered it , its an option to the existing models within the AI tool , for free and local use as you mentioned earlier	

since we require a subscription to use the cloud models of ollama. Which subscription do we need to be able to use the cloud models ?	their pro plan, costs \$20/month.
One question, when we can use ChatGPT & use, then why shall we select different models through Ollama, just a sill question	Ollama models are free, private (data stays on your laptop), and work offline. Use ChatGPT for hard tasks and Ollama for simple or sensitive ones.
follow up: won't it take the context of the whole conversation when switching between models?	Yes, if you switch models midchat, then the entire chat is resent as context.
no im seeing on the ollama GUI app only	please try restarting
i will try reinstalling it again	
instead of opening chat interface	
yes / no?	
codex is better than claude code?	its personal preference
How can I uninstall models on my ollama	You can do using Terminal or Command Prompt commands Run "ollama list" to see your models, then "ollama rm model-name" to delete one (e.g., ollama rm gemma3).
Are all of these models safe for use or would you avoid any in particular?	Running any of them locally is safe, since nothing leaves your machine. Be careful only with their cloud/API versions (DeepSeek, Kimi), where your data goes to their servers, avoid those for sensitive business data.
what if you only replace one in claude	It only uses that. others use the Cloud models directly from Claude.
having it connected to ollama, will chatgpt still remember what it has learned during my other chat?	yes, it will.
Mety Studio and LLM studio all did same work?	yes.
Ollama is not showing GPT in apps, this is the first Screen after installation	can you restart to check
on claude desktop is using fable free?	No Fable is the most expensive model, and you can use it only through the API, which can get extremely expensive.
are these models for doing different tasks like voice, video generation etc or are they just the processors only? Why do we need so many different models...	Most Ollama models are text "brains"; a few also understand images. Different models exist because each is better at something (coding, reasoning, speed, or small size for weaker laptops).
Can Antigravity also get cloud and local models installed?	It includes cloud models built in (Gemini, Claude, and GPT-OSS). As far as I know, it doesn't officially support local Ollama models yet.
so cloud models of ollama are still private ? like output still dosent go to any database, no right?	it does leave your system, but they have a notice saying they dont train on your data
is ther any specific model for BFSI data?	You can use any local model as the data never leaves the local computer.
Do you need a paid subscription to use ollama cloud and another plan to use chatgpt inside it?	yes
Can you kindly provide a sheet like we have for our practical exercises taht allows mr to do what I have not been able in any way shape or form to do during this session, with clear unequivocal instructions and ONE example.	
And, ideally, one page on WHY we are messing all up this way. What is the advantage??	
why kims k3 cloud model paid? whata the difference between cloud vs other models	cloud models are too big to run on your local pc but are much better quality
what is mistral model for?	its a text model
Please answer this, What if I have 64GB RAM? Is this going to work well with the best local models ?	Yes, 64GB is great. You can comfortably run strong models in the 30B range (like Qwen 32B or Gemma 27B), and even some ~70B models at lower quality settings.
what is the advantage of local models	Four advantages. 1. Privacy. Your data never leaves your machine. Nothing sent to a third-party cloud. This is the big one for regulated or confidential work: legal, medical, finance, client data. 2. No cost per use, no limits. Cloud models bill per token and cap usage. A local model runs on your hardware. Unlimited runs, no per-call bill, no rate limits. Wins hard on high-volume repetitive tasks. 3. Full control and independence. No vendor can change the model, raise prices, or shut it off. It's yours. Works offline. Behavior stays stable, no surprise updates. 4. Ownership and customization. Fine-tune it on your own data and fully own the result. No dependence on anyone else's roadmap.
so selecting this local model will mean it will not consume any credits?	yes, they will not csuome credits. It's free.
Why is it better to do chat gpt inside ollama if you are paying for both? The harness was already set up in chat gpt. What am i missing?	You're not missing anything. Ollama isn't for running ChatGPT; it's for free local models. If you already pay for ChatGPT, use Ollama only when you need privacy, offline access, or zero cost.
so now that ollama and GPT are connected - and i search from GPT, it is using the local model through ollama and thus im not getting charged tokens? or lesser tokens?	yes, if you use self hosted ollama models then its free
Any AI Agents that can connect to Yahoo email?	Yes Canary mail and yahoo mail has native built in AI
So, if I want to do scheduled things, which is simple as reading and summarizing my email, I can just use Codex + Gemma for example. This way I can save token, right?	yes, right
Can we get staying ahead newsletter? How can I subscribe (done multiple times but not receiving email yet). Can you let me know so that I can do the needful.	You can signup here: https://stayingahead.ai/
Quick question - if cloud models are paid, why would I use them in ollama. I can use them directly in chatgpt paid plan ?	You wouldn't, if ChatGPT already covers your needs. Ollama Cloud only helps when you want open models bigger than your laptop can run, using the same setup as your local ones.
thanks. On the local ChatGDP model do I need authorization to get to Gmail?	Yes, always. Gmail access needs your permission, so you connect it through Google login (or an app password in n8n); the model itself can't reach your inbox on its own.
what if i put my local model into the fable slot so i have access to my local model as well as models like sonnet or others . will it work ?	yes, it will work.
can i run n8n on Local models? instead of gpt models?	Yes, you can connect local models to n8n. The one catch is, you need to have n8n installed locally too. You cannot use local models while using n8n on n8n.io.
how many local model can be installed in chatgpt, any limit?	No limit except your disk space, since each model takes a few GB. Note it's Ollama (not ChatGPT) that stores local models.
We need better context...why are we doing this? what is the overarching importance? Cheaper? Cuz we have used up our tokens? How would the average person using AI being missing out on thise so called "benefit"?	To understand that it exists, because it's cheaper than standard LLM's, and better data security and privacy because it runs directly on your pc your data technically never leaves your pc. This is often a big selling point especially with enterprise clients
I asked this earlier, are all of the models he has mentioned safe for use - like kimi, deepseek etc. or are there any that you would avoid due to security concerns?	Running them locally is safe, as the model just sits on your machine. The caution is with their cloud/API versions (DeepSeek, Kimi), where data goes to servers in China, so avoid those for sensitive business data.
how will you have continued conversation or multi-stage conversation with harness since it doesnt have memory	by mnaaging context and state at the application layer
Why do you do this in ChatGPT when you have summarize functions directly in your mails nowadays?	Helen, this is to show what is possible. And also to show the power of harnesses.
I have never been so lost or deflated in this whole training. I am not taking all these steps to set up Ollama because i don't understand why i need to do all of it right now or what is really happening. At this point i will just need to revisit the training when i grasp things better. Will this causes any issue for the future classes?	Jennifer, I know this can be a lot. However, none of this will link to anything you do in the upcoming classes. You can take your time to go through all this, and understand all this on your own.
can you explain the reason for this?	
where to check codex usage for the day. Codex plus plan credits gets reset on daily basis, right?	Roohi, as per my understanding, ChatGPT sets usage and displays it for the week only.
why does anyone care about local usage vs browser usage?	there are legal requirements for many industries for this , ie customer data cant leave their local pc

[illegible]
