

AIAP C14 Day 6.1	
Question	Answer
what is schedule for the today and tomrrow please	In IST : Session 1 – Voice Agents (10:00 AM – ~3:00 PM) 10:00 AM – ~1:00 PM: Learning session on voice agents ~1:00 PM – ~3:00 PM: Workbook activity + Breakout rooms for voice agents ~3:00 PM – 4:00 PM: Break (~1 hour) Session 2 – AI MVP (~4:00 PM – ~7:30 PM) 4:00 PM – ~6:30 PM: Learning session ~6:30 PM – ~7:30 PM: Breakout room Q&A with mentors
please provide this	
Will there be two breakout sessions as we have two sessions today?	Sumedha is covering live.
Will there be two breakout sessions as we have two sessions today?	In IST : Session 1 – Voice Agents (10:00 AM – ~3:00 PM) 10:00 AM – ~1:00 PM: Learning session on voice agents ~1:00 PM – ~3:00 PM: Workbook activity + Breakout rooms for voice agents ~3:00 PM – 4:00 PM: Break (~1 hour) Session 2 – AI MVP (~4:00 PM – ~7:30 PM) 4:00 PM – ~6:30 PM: Learning session ~6:30 PM – ~7:30 PM: Breakout room Q&A with mentors
Will there be recordings of these breakout rooms?	Breakout room recordings are not available as zoom doesn't allow recording. But The main session happening right now - recording will be shared.
yday recording is not avb yet	
Where ever we have content to be pasted in workbook, we should be told about the logic and how to customise it.	Yes, makes sense. We will geenrally inform about it. But if we miss during the breakout room, just ask and we will address it.
Are we meant have resources posted already on the LLM?	
dubai	
What is the agenda and timings for today	Session 1 - Voice Agents (Main Session + Breakout Room) - until around 3 pm Session 2 - starting around 4 pm, until about 7 pm.
What is the agenda and timings for today	This is Indian Standard Time (GMT + 5.5)
will i able to clone my voice post this session ?	we may not do this hands on, but a direction on how it can be done will be shared.
Thanks	
yes thats the key Jitesh i need to clone my exact voice and get it used in short form and long form videos. for me thats the application	You will get a direction on how to do this.
Fish Audio , Elevenlabs also Voice agent platforms?	I haven't heard of Fish Audio, but ElevenLabs, yes. They also have more to offer along with voice agents.
WOW Jitesh my mentor.	
Will we get to build a voice agent ourselves today?	yes
can i have matthew linkedin id pls i am not able to locate him by his name	Heyy! Here is Matthew's LinkedIn - https://www.linkedin.com/in/matthew-cohn-4495a0196
will you guys show how to monitise voice agent how can i sell it to business post this session	Matthew will be covering parts of this as well
att does interactive learning assistant work? what is its purpose?	Is your question with respect to Zoom AI Assistant.
What do we call the voice agents that manage interviews, like outbound and inbound? What are they called?	Most of the voice agents that take interviews are outbound. They call the candidate and interview them.
We need to provide the agent Knowledge base as well ?	Yes, there's an option to provide knowledgebase.
along with Context and identity	
can someone explain inbound and outbound call /voice agents ?	Inbound handles incoming calls. Outbound calls up proactively - that's outgoing calls.
Are voice agents legally permitted in all countries, or are there any country-specific restrictions or regulations we need to be aware of?	There could be country specific regulations. You should check out the country regulations before working on it.
We are getting as a resource like Q&A , recording , transcript. but not chat history done during session as mentor use to share a lot import link into that. could you tell us how can we get those as well?	Heyy! Whatever links are shared in chatbox, are part of the resources. Do not worry!
Didn't understand purpose of interactive learning assistant .	Is your question with respect to Zoom AI Assistant?
Actually this question is related to n8n. So n8n help us Automations, so all the tools to create the automation correct? I got asked by someone that "MCP is mainly to connect AI agents to third-party app conversationally". My Question is the tools we connect to n8n flow are not MCP without connecting the AI Agent Action?	MCP is a protocol that allows any software to connect to an AI Agent. If a software/app is MCP supported, it means - it can be connected to an AI Agent.
Can we create a personal voice agent for managing our day to day?	Yes, it's possible.
which chat are we using to interact during the session other than Zoom chat ?	We're only using Zoom Chat.

I would like to understand concern of privacy and surveillance with regards to AI agent who can perform tasks while talking? One will be virtually surrendering their digital privacy in such cases	AI agents that talk and act on your behalf can create a major privacy trade-off: to be useful, they may need access to conversations, email, calendars, files, contacts, location, and third-party accounts. That can turn the agent into a highly detailed record of your habits, relationships, work, and decisions. The key risk is not only hacking—it is excessive data collection, long retention periods, recordings/transcripts being used for training or analytics, and the agent taking actions with overly broad permissions. Minimise exposure by granting least-privilege access, separating personal and work accounts, using short-lived credentials, reviewing logs and retention settings, and requiring confirmation for sensitive actions such as payments, sending messages, or deleting data. Voice agents are especially sensitive because calls may be recorded and transcribed, so users should be informed and consent appropriately.
how are API and plugins different ?	plugins are mcps
How to generate API of a application	If your question is generating API Key, every application has a different way to generate API Key.
apis will be used just for connecting to external systems but MCPs will be used for specific functions like checking calendar or send emails, etc. Please confirm if that's correct understanding based on previous sessions?	Not quite. both can perform specific actions like checking calendars or sending emails. The main difference is that a traditional connection follows strict, fixed paths set by humans, while an MCP connection lets the AI dynamically discover and choose which actions to run on its own.
Thank you Jitesh. My usecase is I want to design an automation with n8n where a data stored in Google sheets (updated weekly) will be added inside Salesforce Marketing Cloud Data Extension (A user-created Database in SFMC). Without this there are other methods like write scripts with API or use multiple flows and FTP servers and what not to complete it. I want to automate it. So is when I connect a trigger of new rows created in sheets (let say) which directly update the DE in SFMC. Is this tools connected is a MCP usecase or its just another Automation?	It's a regular automation use case. You do not need to use MCPs.
how are api and mcp different ?	An API is a direct interface for software: your app calls a specific endpoint (for example, "create calendar event") using predefined inputs and authentication. MCP (Model Context Protocol) is a standard way for AI agents to discover and use tools, data sources, and prompts—often wrapping APIs behind an AI-friendly interface. In short: APIs enable system-to-system actions; MCP makes those capabilities easier and more consistent for LLM-based agents to find and use.
An application we have newly built and hosted on our website, to connect it through MCP to Claude / N8N	
Can we update a Notion database instead of Google Sheets?	yes
Can AI Voice agent will give same satisfaction like a human?	To a decent extent, it depends on a lot of parameters, and we will learn how to customize an AI Agent with different variations so they don't sound robotic.
An application we have newly built and hosted on our website, to connect it through MCP to Claude / N8N - How to get API for this?	You need to ask your website developer to build a secure bridge for your application so external tools can communicate with it. Once created, you can simply plug that connection link into n8n or an MCP server to let AI interact with your website.
I think we should delete the word "can" when it comes to the usage of AI. It is never a question of "can.", but the question is always, "How do we do it?"	valid point.
what is difference between - inbound and outbound agent ?	Inbound is one that handles incoming calls - like a receptionist. Outbound is one that proactively calls and starts talking.
Without connecting voice agent to CRM and real phone numbers, It seems we are just building custom gpt in Retell platform. Can you please add extra session for that? Else it's just a YouTube video of how to use Retell for beginners	valid point, we will learn how to connect with external systems such as calendar and google sheet (as the CRM)
both will be using APIs right?	yes, both could use an API, but using an API is not mandatory
when to use API and when to use a webhook	API is to proactively seek/update information from other system. Webhook is to listen when someone happens on an external system. API is an Action Webhook is a Trigger
Retell is a platform, but from an AI perspective, is it an agent or LLM or what exactly?	Its a platform to build agents on
Retell is a platform, but from an AI perspective, is it an agent or LLM or what exactly?	It's a platform that lets you create Voice AI Agents. It uses LLMs as one of the components.
but what is the use case of API and webhooks; thank you for explaining the difference	API = you ask when you want data ("pull") Webhook = the other system tells you the moment something happens ("push") One example with respect to a payment gateway (Stripe) you call the API to fetch a customer's invoice history or charge a card. Stripe sends a webhook to your server the instant a payment succeeds or a subscription fails
will the calls be recorded	yes, recordings will be shared for the main session, not for breakout rooms.
I am from India. Majority of Indians speak non-English languages. Please also touch upon how to customise it for Indian languages.	Retell does support a ton of non-English language. Popular Indian regional languages are also supported. There's another India-specific Voice AI agent platform called 'Sarvam' that is highly accurate with most regional Indian languages.
Wow, thanks Angelo and Jitesh. So under the hood, what LLM does it use.. it's own or ...	It supports multiple LLMs. GPT 4.1 is the default

Can we have Retell deployed on-premise or within the country?	In regular plans, you cannot deploy it on-premise.
	But, their Enterprise plans support this - costs are usually very high for such plans.
how do we control user sentiment rating like positive, aggressive, etc. in voice agents and will we cover the same today	You can influence and manage user sentiment in a voice agent by combining real-time sentiment detection, clear conversation-state rules, and appropriate escalation paths. Classify signals such as positive, neutral, confused, frustrated, angry/aggressive, or distressed from the caller's words, tone, interruptions, and speaking pace. Put handling rules in the agent prompt, e.g. acknowledge frustration, slow down, avoid arguing, offer a concrete next step, and transfer to a human if abusive behaviour persists. Store the detected sentiment as a call variable/metadata field, so it can drive automations: flag a CRM record, alert staff, prioritise follow-up, or trigger a handoff. For an appointment-booking agent, sentiment should not affect medical eligibility or booking priority unless there is an explicit, safe policy; it should primarily improve tone and escalation.
Will we learn to build Chat agents today?	We will learn how to build Voice AI Agents.
you manually audit the agent conversation or you use another agent to monitor the agent response?	You have both options.
In indian context, is Retell the apt platform from server hosting and data privacy and multi-lingual point of view or you recommend platforms like Bolna ai and Sarvam ai?	For better accuracy for Indian languages, Sarvam, Bolna or Gnana might be better.
what if the agent gets a scam call?	You will have to define what scam call is and the agent can decide to drop the call or so. It all depends on the prompt we give.
Does Retell support Arabic language? Also does it support various Arabic dialects?	Yes, it does support Arabic language
How does the tool manage accents?	Its based on the voice selected
how could we correct those mistakes by looking at the transcript ?	You can add something like - if you are having hard time understanding what the user is mentioning, then ask the user to spellout the word. Something like this. And I would assume this is how we would do it we have hard time understanding something while on call. So, same logic.
I'm guessing it can be localized	Yes, it can be.
If a customer is on another platfrm can we migrate that data into this Retell and onboard.?	Usually customer data is stored on CRM Systems and Retell can connect to CRM Systems to fetch customer data.
can this remind the customer/patient when its time for a teeth cleaning say maybe about once a year on its own?	Yes, we can build such kind of setup.
jitesh how will we buy a number in retell to set up the agent ?	Under Phone Numbers section on RetellAI, there's a way for you to buy a phone number. It requires identity verification. Another alternate way is to use Twilio to buy a number and connect that with Retell
Does Retell integrate with Sarvam, Bolna or Gnana for better accuracy with Indian regional languages?	Not yet, but there's an open feature request on Retell to connect with Sarvam AI
I work for a safari company and want to prototype a speed-to-lead workflow: an enquiry arrives, a Retell voice agent collects travel requirements, and a consultant receives a summary to prepare a quote in Tourplan.	A good demo flow is: dummy web form or test email → create lead in a sandbox table/CRM sheet → trigger Retell outbound or transfer lead details into the call context → Retell collects traveller requirements → webhook sends transcript and extracted fields → consultant receives a summary in a test inbox or Slack/Teams/test dashboard → consultant manually copies the result into a mock "Tourplan quote prep" screen. Retell's webhook model is designed for this kind of real-time handoff, and Tourplan publicly states it supports integrated API and web/XML interfaces, so you can frame the prototype as "Tourplan-ready" without claiming a live booking integration yet
I don't have Tourplan backend access or approval to connect our company Outlook mailbox yet. How can I demonstrate this safely using dummy data and test accounts? What permissions, API access and security checks would we need before connecting the live systems?	there are specific telephone sellers. Twilio does support a lot of countries, but some country phone numbers are not available on Twilio. Every country's regulations are different.
Hi, These are specific telle sellers or any seller in country can work too?	
are twilio calls all VOIP calls?	Not fully VOIP. It works via PSTN carrier
what if we have a dedicated no alraeady	If the number is connected to an SIP Trunk, you can use that.
I can see the benefits of this for a business, and it's good to actively understand how it works. But it's also clear how scammers use it. Same for cloning.	Else, you need to get a number through a telephony provider that supports SIP Trunking
What was this number provider?	Twilio
in real world I will buy ph number from Vodafone/o2 .. will these companies give these details ?	Most likely not, usually there are dedicated telephony providers that provide us the SIP Trunk details.
what is SIP	SIP (Session Initiation Protocol) is the standard that sets up, manages, and ends voice calls over the internet. It's what connects your Retell voice agent to real phone numbers, so the agent can make and receive actual calls instead of just running in a browser.
Can you use an existing phone number?	If your provider provides SIP trunking, then yes.
is there any other AI software like Retell in india..	Bolna is the best
Which Retell app alternative can we use to integrate with Sarvam, Bolna or Gnana?	Sarvam has a built-in Voice AI Agent feature that is like RetellAI itself.
can the same number be used to make multiple calls in parallel ?	yes
inbound and outbound calls - can these/multiple calls be happening simultaeously?	yes it supports multi calls
k	

I don't understand why we need a phone number from twilio when business already has phone number?	Their existing number lives with their current carrier. Retell can't answer calls on it until that number is pointed to Retell's system.
	Twilio is the bridge. You either buy a fresh Twilio number for the agent, or port/forward their existing number through Twilio (via SIP trunking) so the agent picks up.
is voice agent can answer in english only or can be in multiple language?	It can be multiple languages.
what was the second number in the third column?	Could you clarify what this question was with respect to
If the business already have an established phone number for incoming call, how do you use the Twilio number?	You can check with your existing phone number's telephony provider if they support SIP Trunking. If they do, you can use that number
Can we use Ollama also as llm here?	Not really sure Retell allows it. But if that's available, then yes.
Can we have multiple KB.md file? and how voluminous KB.md file can be?	yes, you can add multiple.
	Usually KB should be same for all customers.
When there are multiple KB for multiple customer, how Agent knows which one to use	If there's something that is different per customer, that shouldn't be in the KB. It should be on the CRM and we can integrate the Agent to connect to a CRM via API/MCP.
Is knowledge separate for a different domain business	yes.
for each agent we need a separate twilio number?	For Inbound - 1 Agent per number For Outbound - you can connect multiple agents per number
For the knowledge base to be good enough, the quantum of data required could be huge...especially for multiple use case ones	Yes, you can add this. RAG systems are designed to handle high volume of data.
So keep the prompt just to what is required for action, while details, understanding and process area in knowledge base - correct	That's correct.
Can we have multiple agents connected to same phone #?	Inbound - 1 agent per number Outbound - you can connect multiple agents per number
how to check if Retell allows it or not?	Could you share your full query?
Hi Jitesh - what Matthew is showing will we do that in breakout room today with the help of a mentor	Yes.
is there a plan to teach how to integrate local LLM?	This may not be covered
where is the non-conversational flow generally used or recommended	Conversation Flow when the call must follow a fixed sequence with real branching - appointment booking, lead qualification, insurance/KYC intake, payment collection. Anywhere you need guaranteed step order, conditional paths, and a function firing at a specific node.
Who is supposed to provide these knowledge bases to create voice agents? Is it the potential clients/businesses who should provide to the vendor? If yes, what should the format be	The client owns the knowledge, and the vendor/builder needs to populate this in the right format. Ask the business for existing material first: website pages, FAQ documents, brochures, SOPs, product sheets, price lists, terms and conditions, email templates, call scripts, and anonymised examples of genuine enquiries. Retell supports a broad range of document types, including PDF, Word, CSV, Excel, HTML, Markdown, text, website URLs, Google Drive, OneDrive, and Notion sources; its documentation recommends Markdown over plain text. On LMS, you'll get access to sample knowledge base that you can adapt as well
Can Retell handle Hinglish? If not, what is the best platform for that?	Yes, it can handle it fairly well. You can enable multi-lingual
can we set up a voice agent to only pick up after hours? And therefore make it part of the message that they are helping because it is after hours	good idea, but this check happens before it comes to Retell. So, it can happen at the Telephony provider layer. Usually Twilio Studio has a feature to let you set this rule.
Will we get this prompt transcribed?	Not required, English prompt should be fine.
is it fixed cost for agent per min or variable with any parameter?	Yes, it's a combination of all the services and models being used. If we use voice from ElevenLabs, the cost will be different from the other provider. Likewise for LLM and everything that's needed. But you will know what's the cost for each call.
What determines latency and if it is slow, can we change it?	Yes, depends on the models you choose and some settings.
But how will we know how many tokens an agent will use? Wouldn't that also depend on the conversation length from the customer? Suppose we have an agent with, let's say, 4,000 tokens. The call should not drop if the customer is still talking, isn't it? How do we balance it?	Token use is variable: it depends on the system prompt, conversation history, retrieved knowledge, tool calls, and the customer's answers. A 4,000-token figure is normally a context/billing threshold, not a rule that automatically drops a caller mid-conversation. How to balance it Keep the core agent prompt short and focused; do not paste entire manuals or large FAQ sets into it. Put factual reference material in a knowledge base, so only relevant content is retrieved when needed. Retell supports knowledge bases alongside prompts and integrations. Use structured conversation flows: identify intent, ask only essential questions, confirm the summary, then hand off or end. Put a sensible operational cap on calls, for example 10–15 minutes for lead qualification, but program the agent to warn, summarise, and arrange a callback before that limit rather than abruptly ending. Configure a silence timeout to close abandoned calls, not active conversations. Retell exposes both call-duration & response-wait controls
I am guessing any kind of spam or malicious user/competition can try to jack up the costs of the supporting AI infra... How can this be managed, if at all?	great point. You can set some guardrails at a Telephony layer to block certain calls based on rules such as - if a caller calls too many times, then block the caller.

Can I use OpenRouter in Retell?	OpenRouter is not supported
The model also defines the accuracy, right? Does Gemini 3 has accuracy as well?	Yes it does
Hi, Is Sarvam, as it is comparatively new, at par level to Retellai to start building voice agents for Indian clients?	While it's arguable, I personally think Sarvam has the highest level of accuracy for local Indian languages.
can we put our own voice in the voice agent? to make it sound more natural?	Yes, it's possible to do. ElevenLabs supports voice cloning feature and that can be used on RetellAI as a custom voice.
Are there options to change the language? I want the voice agent in German.	Yes, there's an option.
can we set different accent for different callers of different countries	One Agent can only have one voice. If you need different voice accents, you need to create different voice agents. And, then route to the expected Agent based on the country from where the call is coming from. I think you can do this routing using Twilio Studio.
great. Thanks Jitesh	
what if I want agent to answer in the the language the caller is calling	You can enable multi-lingual and the agent can automatically switch language.
what if I want agent to answer in the the language the caller is calling	You can enable multiselect lanuage mode/multi lingual
Check out, recently, 3-4 weeks back, Microsoft also released voice agents and voice modulations that give very realistic Indian emotions. Hindi is fantastic.	yes, this looks promising.
https://microsoft.ai/news/mai-voice-2/	
if we provide multi languages, how will agent identify which language to use for indian customer or a UK person? Does it takes it on the basis of user locale in settings	It can automatically switch to a different language based on what the human at the other end is speaking.
Are there toggles where you could, for example, choose Female, 30s, Scottish, also available in French	There are no fixed toggles, but you can choose from various voices - each having some fixed settings.
can the user select the languate in multi language model	yes.
if the call is taken in a different language, can the transcript be translated into english or will that have to be done separately?	Separate step. Retell's transcript comes back in the spoken language - it's a record of the call, not a translation layer.
Will we get this prompt in text?	yes
which prompting technique is used here?	It's Role-based structured prompting Close to RTF (Role-Task-Format)
How do you train your agent?	You don't train it in the ML sense - there's no fine-tuning. You iterate on the prompt, add a knowledge base for facts
What are alternatives of Retell in India?	Bolna, Sarvam
What are alternatives for Twilio in India?	Vobiz
Retell does not support Ollama. Thanks,	you're right
Does the agent has to tell the customer it is AI?	You can configure it that way. Normally it doesn't
Can you adapt your agent real time based on language and accent of the incoming call? It could be a multilingual, multi accent agent or different agents with specialities around language and accent. Ideally the 1st one would be desired. Not sure how easy or difficult it is.	yes, it can switch the language in real-time, but voice accent cannot be switched in real-time
pls , what is email id for coupon code support?	support@outskill.com
Hi Jitesh, Thank you for the inputs. Just a question on different note, Sarvam is having voice agents deployed. Then what next can we do to get other business rolling contracts to us to deply there usecase using Sarvam ?	Sarvam sells the models + platform, not the implementation. They won't build the client's telephony, CRM writeback, or escalation logic.
I know not for this session, just a curiosity !	That's where we can fill in the gap to acquire contracts.
Would this knowledgebase require the chunking and embeddingprocess that jitesh thought us the last time ?	The process is automatically handled behind the scenes.
What is the quantum of knowledge base (memory) that can be uploaded for training. Any benchmarks?	For Retell, Hard limits: 25 files per knowledge base, 50MB each
what if you rcv a call and AI agent starts talking, and then caller is talking to some one else in front of him or her while the agent is talking and then gets back to the call, will the AI agent repeat the welcome message?	yes, it might, or it might check if they heard them.
Ca one configure his own voice as an agent? Is it easy?	Yes - Retell doesn't clone voices itself, but you bring your own from ElevenLabs, add your provider API key in settings, and your cloned voice shows up in the agent's voice list. Effort is low: ~1-3 minutes of clean audio for an ElevenLabs instant clone, maybe 10 minutes end to end.
Wonderful. Thank you Jitesh	
I dont understand latency, how is 730 ms better than 540ms, or am I missing something? How to decide which latency is better?	You're not missing anything - lower is better. 540ms is better than 730ms. Latency = delay from caller finishing speaking to agent starting to speak. Benchmarks: under 800ms feels natural, ~1s noticeable, over 1.5s people start talking over the agent. The trade-off is that the lowest-latency voices are usually the least expressive. So pick the most natural-sounding voice that still lands under ~800ms total - don't chase the smallest number for its own sake.
can we not design the agent in a way that it stops speaking when the customer startes speaking	yes, it's possible.
can you explain latency?	Latency = delay from caller finishing speaking to agent starting to speak.

can the latency be dynamically adjusted? based on the trends of customer unpredictability over the call?	No, this cannot be handled automatically.
Is the voice agent / LLM smart enough to understand that over a call?	
There are couple of brands who have the best resources (agents who are able to handle customer queries), possible to train AI with couple of recordings, so that it understands the language articulation, sophistication, etc?	There's no built in way to train the AI using recordings. But, we can feed those recordings into a AI engine to help you generate a prompt or improve your prompt to handle better.
How to ask the caller to select the language before a call starts?	You can create a conversational flow for this.
can the agent be multi lingual. eg : English and Hindi.. speak interchangeably as per the caller from the other side	Yes, it can.
can i connect this with my claude and brief the claude to build it like we did yesterday for haygen?	Yes, Retell does support MCPs. Using MCPs, you can connect Retell with Claude AI - https://docs.retellai.com/get-started/mcp-server Then, you can ask Claude to build it. However, we suggest you to start building it yourself to understand how it works. So, you are better prepared to handle situations where the Agent is not working as expected.
A question for Matthew - For Outbound calls, do you prefer to introduce agent to mention that its an AI agent or rather just keep it subtle so we may not loose out attention and build relation when prespecting !	most people already understand its an AI these days. so, its ideally not a good idea to hide that fact. Can keep it simple. helps building trust.
can we have a quick break	
also is there a setup wherein AI can handover to a person if it cannot respond?	yes, human hand over is possible.
what would be the issue if we set call duration limit to an hour ?	It will increase your bill
if we keep max duration to 5 minutes and the conversation goes for longer, then will the call be disconnected abruptly and if not, what is the significance of this setting	You can use a setting called "End Call on Silence" that will end the call if user stays silent for extended period of time.
is it possible that if call duration exceeds permissible lngth then agents transfer the call to human?	This feature is not supported natively on RetellAI.
can this data be Indian server?	Retell does not support hosting on Indian servers on their regular plans. There are a few Indian providers for Voice AI Agent platforms.
What happens if multiple people calling at same time? Will it return busy or take calls in parallel?	It can take calls in parallel
what happened if the actual call duration exceeds the max call setting. Will the agent just cut off the conversation with the caller?	You can use a setting called "End Call on Silence" that will end the call if user stays silent for extended period of time.
will retell works in any language or only english?	any language
how to set up inbound call reaction behaviour if it is one of the earlier customers and if it is new customer	You can connect RetellAI to your CRM that helps it know if a customer is an existing one or a new one. then, in the prompt, you can explain the behavior to follow for new vs existing.
As a personal voice agent, can this take over my inbound calls, if I do not answer my phone call? Let's say after 5 rings	may not be directly. but if you can set up a call forwarding at your end to the agent number when you dont answer the calls, then the agent will do the rest.
can you also forward a call? Like an assistant forwarding the call to you?	yes
ok thanks	
i have inbound calls from customers from US who are upset and often use abusive language . how will the agent handel this ? they switch languages in one sentence spanish to english or vice versa with local lingos and sound like the hood often	you can mention what the agent has to do when users use such language. also, choose a voice which understands English and Spanish both.
Is Vapi same as Retell?	Yes, both are similar Voice AI agent building platforms.
can we do this practically now	We will do in the breakout rooms.
10	
thanks	
10	
can u pls ask mentor to cover this call forwarding just mentioned by Rick	
Do we have a Indian Platform, as Rete;ll is a bit expensive WRT per call and min counts? somewhere about 15/- per min its calculating	Sarvam, Gnana, Bolna are indian platforms.
what about for Filipino female voice?	you can add that
How do these agents know if someone's just wasting time?	if the user is trying to just talk some rubbish rather than any questions related to your business even after the agent has clearly mentioned that's not what the agent can help with... something like a user calling a dentist and asking for software development or something more. also, you have a max call duration. so if the user tries to keep talking about the same thing again and again.
Why are the guard rails optional? Shoudn't the be enabled by default or rather inbuilt like a system prompt in retell?	Retell doesn't force guardrails on because the same rule that protects one business breaks another. So, it's best to add your custom guardrails on your own
i love the call screener idea- i remember equal ai but that didnt work well on my samsung A series phone- any approach to creating such an agent	
Hi Jitesh , what was the picture you showed for 3D embedding modelling for pinecone dimensions. where could i see that vusualisation	https://projector.tensorflow.org/
kinda sleepy	
Is the breakout session still expected to be at 1pm?	tentatively around that time.
context and identity	

Any good agents for Arabic + Hindi?	RetellAI, VAPI, Elevenlabs - all support both Arabic + Hindi
Any good agents for conversational Dutch, Chinese and English - US & India? Do India based AI services Sarvam or Gnana support all these languages?	For these languages, better to use RetellAI, Vapi, or ElevenLabs.
we can get the prompt form any ai right by following prompting techniques, is it any different in retell	That's right. You can do that. Retell does provide a prompting guide too that can be used to make the prompt better
Did Matthew suggest twilio earlier to buy a local phone number to connect with Retell ai? Or was it meant for something else?	Yes, you heard it right.
should a task say "book an appointment only if thats what is needed" so that the AI doesnt pressure the caller into an appointment?	yes, doing something like this is good.
I did not quite catch the part about ** and ## in the prompt. What is it once again please?	These are characters that are used in markdown text format. ** means bold text ## means heading
how do we have the agent switch languages whilst the talk/is it possible - for example in india people speak a mix of hindi and english and can switch languages in the middle of the conversation. how do we deal with that?	If you enable Multi-lingual, agent can switch dynamically based on what the agent is speaking
I am wondering are these agents dedicated for a singular purpose, like what we are seeing is only booking appointments. what if a user calls for some other purpose?	valid point, for the demo, we picked up a single purpose agent, but you can add more aspects on the prompt to make it handle more purposes.
Hi Jitesh - do we get the markdown prompting from chatgpt / claude ?	You can just ask ChatGPT/Claude to give you markdown format.
In your experience, is it better to highlight that it is an AI Assistant that the customer is speaking to?	For some countries, the guidelines mandate you to declare to humans that they're speaking to an AI. If the country does not mandate, it's still a better practice to mention this.
If i set Max call duration to 5 minutes and the conversation exceeded the 5 minutes what will happen? will the call be disconnected after 5 minutes ?	Yes. If the maximum call duration is set to 5 minutes, Retell will automatically end the call once it reaches that limit—even if the caller is still speaking. The limit is a hard safeguard against unusually long or spam calls.
there is no mention of what would happen if the caller tells something not related to dental, so how would the ai relate to it, or by default it will book an appointment	good point, you can mention this on your prompt.
If we have build the workflow in n8n, does it cost token everytime we use it? For example for the gmail assistant that we built yesterday if we use it as a scheduled task in Claude.	yes
what if a patient is a regular visitor (may once a month) or close friend/relative of doctor? do you think we can add known patient/friends/relative numbers with their medical history, not sure if legally permitted?	yes you can have a database
Why need to tell her that she is an AI agent?	some countries have enforced laws where we must declare to humans that they are talking to an AI Agent. Beyond that, it's a choice that you can make at a personal/business level.
in UK, customer service asks for spellings like alpha, britain, cat, etc. (words starting with the alphabet) so how does one set that?	You can configure this in Retell by enabling its NATO Phonetic Alphabet preset, which makes the agent confirm spellings using "Alfa, Bravo, Charlie" with clear pauses. It is intended for names, email addresses, booking references, account IDs, and other details that must be captured accurately.
don't we mention in prompt not to do these things like **never provide** any suggestion to resolve the issue like gargle or brush deeply or use some medicine.	Yes, it's a good idea to mention these.
Can we integrate Retell to a community edition / self hosted n8n?	Yes, it can be.
when asking for phone onenumber at a time, are we waiting for confirmation for each number	Not really, the entire number can be confirmed in one go too.
thank you	
re we filling the CRM form as well while the agent collects this information	Not sure if I understood your question. But, if you want to know if the AI Agent can collect information on the call and fill into the CRM.
Do we get the complete prompt for this Bright Smile Dental example?	yes
I see. May I know which countries currently have such guidelines? Thank you,	It's added in EU jurisdiction. It was live since Aug 2026
how to add music during hold time?	It doesn't hold for so long. So, adding music is not needed. It will just be a few secs for API calls.
Can we configure the function call to check "Odoor Appointment App" where we manage the meeting schedule?	Absolutely - that's the way to do this.
yes if agent can collect the information and in this specific example which matthew is demonstrating are we also including the step where the agent collects the information and fill in the CRM	Yes—Retell can collect caller information, but the CRM update is usually a separate integration step after the call. The agent gathers details during the conversation; then Retell's post-call extraction creates structured fields and a summary from the transcript. To fill the CRM automatically, connect Retell's call_analyzed webhook to an automation tool such as n8n, Make, Zapier, or a custom backend.
And can we also cover these important topics in indian environment mainly - Legal & Regulatory Concerns, Privacy & Data Security, Spam & Trust Issues and most importantly Accuracy & Misrepresentation Risks by AI calling agent	This may not be covered in the main session, we will have a Slido Q&A in the breakout rooms after completing the workbooks.
We are getting as a resource like Q&A, recording, transcript, but not chat history done during session as mentor use to share a lot import link into that. could you tell us how can we get those as well as i am not able to see those link in resource as well. could you share link for those containing links?	
how could we minimize giving all these insights to retellai isn't there some other agent for that as well ?	It's possible to integrate with Claude AI
during the conversation, will the ai agent switch between language if the caller is bilingual and change language during that conversation?	you can do that

Do we provide restriction in prompt: don't book the calendar one month in advance just for 30 days in advance?	yes that is doable
but different services may take different amount of time. so that will need to be on the knowledge base so that once an appointment is booked, it blocks the schedule for the next appointment available accordingly?	Yes, different services should have different appointment durations—but this should be handled by the booking configuration and calendar/tool logic, not only by a knowledge base.
What is inside this functions?	These functions have a connection to external systems. In this case, they connect to a calendar to book appointments.
what if caller stuck to same data and time again and again, can we ask agent to exit after 3 try?	yes, it's possible to provide this in the agent's prompt.
Can we instruct the agent to answer few questions which are dynamic in nature such as gold price today or anything else..?	Yes, we can do this. We need to create functions that can call APIs to fetch gold price, etc.
yes	
how agent knows, what duration to be block? which treatments will take what time?	Usually when you create the function to book appointments, there's a fixed time defined. You can create different functions for each time duration.
Hi there - Can we send outbound SMS to customers after confirmation of allotment of slot. Or we have to integrate it with MCP. Like yesterday we did	there's no native SMS feature on Retell, so we have to integrate via APIs or MCPs to send SMS
Do we have any workbook for text /chat kind of AI agent session?	we have a workbook today for a Voice AI Agent.
Can the agent classify the meeting type and use dedicated appointment calendars? Suppose we have separate meeting appointment calendars for Partner Meeting, Customer Meeting with different times allocated.	Yes, you can create separate functions for each calendar and on the prompt, mention which function to use when.
and can we also cover these important topics in indian environment mainly - Legal & Regulatory Concerns, Privacy & Data Security, Spam & Trust Issues and most importantly Accuracy & Misrepresentation Risks by AI calling agent	This may not be covered in the main session, we will have a Slido Q&A in the breakout rooms after completing the workbooks.
Can we also cover the integration of the CRM form	we will cover integration with a Google Sheet using n8n. The same process can be used to feed into a CRM.
We are defining same context twice, it will increase cost due to token size. is it ok?	It might increase slightly, impact is minimal.
in important notes, it starts with ## and ends with **? why? rest of them use the ** at start and end	This is a markdown text format. Markdown means ** means bold text ## means heading
Thank you that will be great	
why just current date and time, how would we know what it knows and what it doesn't know?	It does not know recent information as it does not have web search built-in in most cases. For appointment booking, as current datetime is critical, we provide the current date and time.
Will we get this full prompt ...?	yes
y	
thanks	
yes	
date and time on the start make sense but why also at the end of the prompt	That's not required, could be an oversight.
Hi - Can we set Clinic timings and slot timings before booking of slot in the prompt	Yes, great idea. it can be done.
too much information in one go... overwhelming but interesting	
in important notes, it starts with ## and ends with **? why? rest of them use the ** at start and end. So it can be both bold and heading?	that's correct. It's both bold and heading.
in india there are more regional languages. Does voice agent perform well in all the regional languages?	Retell does have some regional Indian languages. If you need more extensive regional Indian languages, there are platforms like Sarvam, Bolna, Gnana.
i think it is. In function as he is explaining right now	yes,
Can an MCP give us the prompt?	MCPs are not meant to get the prompt. MCPs are connectors to external apps.
v have to do it side by side now?	No, we will build it during the breakout rooms.
IS IT A GOOD PRACTICE TO LET THE AGENT FOLLOW UP WITH A FOLLOWUP EMAIL WITH THE APPOINTMENT. IS IT EASY TO INTEGRATE THAT?	Yes, great idea. It's possible to do. But in our example- cal.com already sends a notification upon appointment booking. If you want to send a follow-up email, you can do using automation tools such as n8n. Retell AI is not best suited for sending follow-ups.
Sorry meant is there an app for this kind of prompt?	You can use Claude/ChatGPT/Gemini to generate this kind of prompts.
Can cal.com connect with Claude for an MCP integration to scheduling?	Yes, Cal.com does support MCPs that can connect to Claude
GREAT. THANKS	
Why to use cal.com and not google calendar directly	great question. Integrating with Google Calendar directly is a bit complex, Cal.com acts as a bridge to simplify this.
Why is Matthew using cal.com instead of using an API directly from Google Calendar? We have studied it anyway using n8n, right?	great question. Integrating with Google Calendar directly is a bit complex, Cal.com acts as a bridge to simplify this.
What is cal.com about?	Integrating with Google Calendar directly is a bit complex, Cal.com acts as a bridge to simplify this.
Do we have to use cal.com? can we not connect google calendar directly to retell?	Integrating with Google Calendar directly is a bit complex, Cal.com acts as a bridge to simplify this.
NVM, answered	

how to configure cal.com to make sure we have at least 30 mins in between appointment to allow for travelling time in between meetings	Cal.com does provide this setting when creating meeting.
what if the dental practice has multiple dentists with different calendars?	For a dental practice with multiple dentists, the agent should not use one shared diary blindly. It should check the correct clinician's calendar—or a scheduling layer that already combines clinicians' availability—based on the treatment, required skills, location, and the patient's preference. Google Calendar's FreeBusy API can return availability across a set of calendars.
How will we get the Event type ID?	You can copy from the Event URL on Cal.com
don't we have to make function reference changes in prompt since we deleted old functions and created new with different names?	Valid point. However, the LLM's intelligence automatically identifies similar-looking names to use the correct function. But, still better to ensure that the function name is corrected.
Can we use different LLM models for the prompt for the agent and call extractor?	yes
PLEASE, JITESH, WILL IT BE LIKE AFTER THE APPOINTMENT, THE N8N MCP'S TRIGGER WILL BE CALENDAR APPOINTMENT WITH DETAILS SENT TO GMAIL TOOL?	After appointment booked, use n8n to store into a database (such as Google Sheet) Then, create another workflow on n8n to trigger everyday that checks any appointments for the day from Google Sheets, and then send them notification email.
Sorry, but this style of teaching is terrible. I am no able to keep track of everything he is saying. Am i supposed to have this on my pc and do the steps he is saying?	We will have a hands on breakout room with a workbook exercise where you can build this hands on with mentor help.
Would that not cause context loss?	
Isn't long prompt cost higher token. Is this the case for the post call extraction as well?	Yes. A longer live-agent prompt can increase cost because Retell counts prompt/context tokens, including the global prompt, tool descriptions, conversation transcript, tool history, and retrieved knowledge-base content. Once the context exceeds 4,000 tokens, Retell scales billed call duration proportionally. For post-call extraction, the principle is similar: it is an LLM task that reads the completed transcript and follows your extraction instructions. More complex or verbose extraction prompts, more fields, and longer transcripts require more processing—so keep the instructions and requested outputs focused. Retell lets you extract structured Boolean, text, number, and selector fields after the call.
when will the breakoutroom start this is all theory we need to do all this in breakout room	We will have breakout room soon after the session. We will build a voice agent during that.
hi what webhook is?	Webhook is a listener, It gives us an ability to notify an external system (here n8n) when the call ends.
Why a web hook? Why not an email? That would be easier, right?	So, when the call ends, a webhook triggers a workflow on n8n. Most agents prefer to give a webhook as the easiest way to generalise data transfer.
do we have documentation on webhooks in LMS?	
Q for Matt later - Does Matt recommend we are upfront about outbound calls being from an AI agent?	
most dentists already have a contact number for their clinic - and wouldnt want to change that even if they go with an AI agent - how will that work?	It is possible to use an existing number, but we need to work with a telephony provider that can migrate our existing number and provide us the SIP trunk details. Once we have the SIP trunk details, those can be connected to these voice agent platforms.
Understood. So the STUFF is that we can use n8n MCPs to trigger the various connections	Yup, that's right.
Mindblowing	
Thankyou	
thanks	
i love this session cos the joke part where does that agent pick up cos is it part of the prompt description, then the code number is better to ask	
can the ai agent itself cann the customer	:) technically, it can.. you can try for fun.
does the E164 prompt automatically assign +44 for UK to the phonenumber? Because the surgery is in the UK? What if the dental practice gets a lot of international patients?	yes, it does.
let's say if the customer says less than 10 digits, have we put any condition for that in retell, saying, "seems like you haven't said your complete number"...do we have that feature?	We can add that if needed. Prompt can be adapted based on our use cases. The call transcript actually helps us understand where users are going wrong and adjust the prompts as we use it.
so for this to work we'll hv to host n8n on the cloud?	The entire flow is now being shown using n8n cloud. Not self-hosted one.
call*	
Hi, How to handle for International client, in case if it comes from other country ? Like Matthew entered UK code, if the call came from France then ?	Doesn't matter. It will just answer the call and run the way it's intended to.
but how do i do it??	
for a travel agency or hospital we get foregin travellers so we can use the E164 format in the basic prompt for the phone number so they dont have to ask for this info again.	Yes, that's the recommended approach. or you can add conversion via the prompt, which is little more expensive overall
We might have clients giving extra digits/ wrong phone number, can we restrict that to 10 digit (India), and do we need to collect the email ID to block their Google Calandar?	In the prompt, you can mention to the AI agent to only accept 10-digit phone numbers, and you can also ask it to collect email addresses.
So the agent should ask for country of origin before asking for the phone number? because the correct format should be save (if target audience is from multiple coutries)	
whst is the need to have post call transcript? is it for us for testing purpose or any other usecase	This is for you to store it for future review/analysis.
don't we have to make function reference changes in prompt since we deleted old functions and created new with different names? How did the prompt refer new functions	Yes, this is a valid point, but if the names are slightly different, the agent automatically picks up the correct one. This is based on the LLM's intelligence.
will this n8n be also executed in breakout room	No, this part is not included in the breakout room workbook

IF the caller call in non-English language, will automatically switch the language or there is some setting to be revised	You have to mention it in the prompt
Are these configurable over VoIP call? For example, some customer calls over a whatsapp call?	No, WhatsApp call is not integratable within Retell so far.
Hi Ritesh, Ok but as Matthew faced the number issue with VAgent, was it his issue only ?	
Hi, Can Recursive splitter to change this word to word splitting ? Or this seperate thing than what I am mentioning ?	
Can Webhook work along with Kafka ? listen to the topic. Or its only Push mechanism of some service to push data to Webhook ?	
https://us06web.zoom.us/webinar/register/WN_dR8JDdmxR2io5gD_MEvkJA#/registration	
if the excel sheet has to remind the clinic on the upcoming booking and wanted to remind the caller one day ahead to confirm they will come for the appointment or wanted to rescheule which node can i use for that in the n8n automation? calander or anyother function for that?	You can use n8n's schedule trigger to check the Google Calendar for all the upcoming appointments in the next 30 minutes, and then, if there are any, you can send them a reminder message.
does retail have a built in-voice handling hindi language or local indian langages or i need to have eleven labs and then train the voice?	It has but eleven labs is better
also can the prompts be written by chatgpt?	yes
why not use the append and update option in n8n for thr Google Sheets, in case someone changes their appointment? How does the voice agent handle such queries?	Valid point. You can use append and update as well, but that should have a unique identifier. If you are storing at least one unique identifier, you can use that.
Can we use different Llm models for the prompt for the agent and call extractor? Would that not cause context loss?	
are there alternatives for VoIP calls like WhatsApp?	Astra by Wati supports Voice AI Agents on WhatsApp
What is actually the Webhook - an api or MCP?	It's neither. Webhook is API in reverse direction. Example - if App 1 uses API to App2 .. For App 1, this is an API, and For App 2, it's a webhook. API = you ask. Your system initiates. You decide when. Webhook = you get told. Consider an example for Stripe Payment Gateway. API: You call Stripe to check if the payment went through. Webhook: Stripe calls you the moment it does.
what is schema/table/json?	These are 3 ways to look at the output data on n8n.
yes	
is there support for local indian langauges like telugu or kanada?	Yes, some Voices/LLMs on Retell support this. You can even try Sarvam AI that is much better built for regional Indian languages.
Okay, would Astra be able support both regular calls + Whatsapps calls? Just to keep it consolidated.	Yes. it does.
the google sheet is great, but having worked in CX before, it becomes very heavy especially if we add the recording URL	valid point, you can replace with any CRM.
is there an alternat solution for it?	
Does the values being copy and pasted for the specific field produced are in the same title are being setup in the post call extraction ?	
can i go to claude to get the international number for the phone number column aswell. to automatically fill with +91 838475384 can u pleas show us that way	
can i have the retail agenk speak in french and use google translate to change to english only for recording transcript and having to generate call summary etc?	
why we used Future flow	Futureflow is Matthew's Voice AI Agency.
all this without publishing evrytime in n8n	You have to finally publish the n8n workflow.
Are we trying webhook connection in breakout room	No, that's not a part of the breakout room workbook.
where we will get this docs ?	
Webhook can be connected to the CRM instead of the Google sheet, right?	That's correct..
Okay.If I want to know more about it, what should i do?	
couldnt wait to build one..	
When we make voice agents for our clients, should we built it in our retell account or clients retell account?	
How to monetize this with a Json file?	
pls share the links here which matthew is showing all the resources	
In India, we have Personal Data protection act and hence contact no. and name needs to be protected. Give us some information on securing the Personal data	
I need to capture photos and videos from inbound calls (for vehicle servicing - to understand the issue) - So can a voice agent handle this say via WhatsApp business?	
where would we get the documents that matthew gave us ?	will be added on the LMS resources section.
Hi, Matthew faced the number issue with VAgent, country code snag, was it his issue only ? if not how we need to address the issue international clients outside of our country ?	
Don't we need the promp created by claude in markdown format	

How to import JSON	Create a new workflow on n8n→ Click on the 3 dots on the top-left near the workflow name and then click Import from File, and then choose the JSON file.
Absolutely	
can you customize the agents voice	yes, you can choose custom voice. You can also clone your own voice and use that.
when r v building one ?	
5min	
What about Lunch break?	
yes	
LMS recordings will be available forever or only 1 year?	
can voice agent have our voice too?	yes, you can clone your voice using Elevenlabs and connect that as a custom voice on RetellAI
how can we embed voice agents to website?	yes, we can.
but this bonus voice tool is only if we are in india?	
can i have the url for trello please	http://twilio.com/
got it thanks	
why we need voice link. Cant we directly connect our phone number ?	
next session is at 4pm ist?	yes
